

# Machine Etruxure™

## Preventa solutions for efficient machine safety

Catalog

April 2015

# How can you fit a 6000-page catalog in your pocket ?

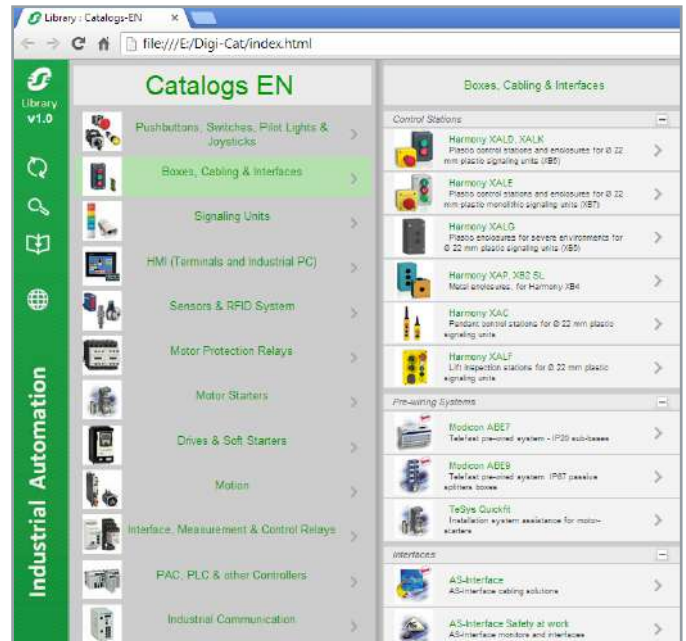

Schneider Electric provides you with the complete set of industrial automation catalogs all on a handy USB key for PC or in an application for tablets

## Digi-Cat, a handy USB key for PC

- > Convenient to carry
- > Always up-to-date
- > Environmentally friendly
- > Easy-to-share format

Contact your local representative to get your own Digi-Cat

## e-Library, the app for tablets

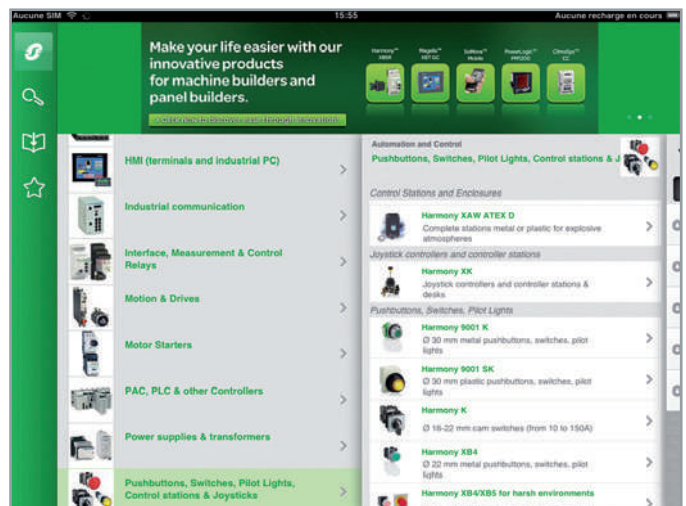

If you have an iPad®:

- > Go to the App Store and search for e-Library
- > or scan the QR code

If you have an Android tablet:

- > Go to the Google Play Store™ and search for eLibrary
- > or scan the QR code

Product Approach

Schneider Electric Safety Approach

**Schneider Electric is one provider of the complete safety chain.**

In addition to moral obligation and economic consequences, the law requires that machinery operates safely in the interests of accident prevention. Preventa offers an extensive range of safety products, compliant with international standards, designed to provide the most comprehensive protection for personnel and equipment.

**Acquire the information**

- > Generic protective measures - Emergency stop
- > Two hand control stations and enabling switches for starting and enabling of dangerous movements
- > Protective guard devices used as part of safeguarding systems to control the access under specific conditions of reduced risk
- > Light curtains to detect approach to dangerous and limited areas

**Monitor and processing**

- > Safety modules manage one safety function, monitoring inputs from safety devices and managing the outputs to contactors and drives
- > Safety controllers: configurable safety device capable of managing multiple safety functions simultaneously
- > Safety PLCs: programmable electronic systems for complex distributed safety applications

**Stop the machine**

- > Contactors to cut-off the electrical power supply to the motors with mechanically linked mirror auxiliary contacts integrated for the feedback loop diagnosis used by the safety modules, controller and PLCs
- > Variable speed drives and servo drives provide controlled stopping of the machine by using embedded safety functions
- > Rotary switch disconnectors: for equipment isolation from the electrical supply and for emergency stop by direct interruption of the power supply

### Solution Approach

### Schneider Electric Safety Approach

**One provider for the complete safety chain**

- > Emergency stop
- > Perimeter guarding
- > Guard monitoring
- > Enabling movement
- > Speed monitoring
- > Position monitoring

The Safety Chain Solutions are TÜV certified safety architectures based upon the most common safety functions required on and around a machine. The safety chain solutions enable you to save time and costs when designing and manufacturing your machine in accordance with the European Machinery Directive.

**Each solution comes with:**

- > Bill of materials and the system description file
- > Wiring diagram
- > Layout of solution indicating performance level (PL) and safety integrity level (SIL)
- > Description of the Performance Level and Safety Integrity Level calculation for the safety function
- > Sistema Library file with corresponding solution
- > TÜV certification

1

### Machine Solutions Services & Support

Service and support that are behind you all the way

#### Design

##### We find the best solution for your needs

- > Based on your needs, System and Architecture Experts and Application Design Experts (SAE/ADE) work out innovative technical solutions including
  - > Co-engineering
  - > Tests
  - > Validation

##### We understand your pain points

- > Consulting

##### We execute the solution with a full service agreement

- > Our solution design and project centers (Flex-Centres) are committed to quality and results and provide:
  - > Project and program management
  - > Software and hardware engineering
  - > Tests, validation, and commissioning

##### We improve your team's competencies

- > In class training and on site training

#### Build

##### We ensure the delivery of your solution

- > Availability of components through a large worldwide network of distributors
- > Collaboration, management, and delivery through local partners
- > With Schneider Electric as your turnkey solution partner we include in our solutions:
  - > Project management and responsibility
  - > Engineered systems
  - > Third-party components management

##### We provide on-site services and support

- > Qualified personnel to deliver on-site engineering and technical services

##### We improve your service team's competencies

- > Service and commissioning training

#### Operate

##### We provide international sales and after-sales services for you and your customers

- > Maintenance contracts
- > Spares parts
- > Repairs
- > Normal and express deliveries
- > Service expertise:
  - > Error diagnosis and repair
  - > Environmental measurements ( EMC, field bus, thermography, power quality analyses, etc.)
- > Customer International Support (CIS) as a single point of contact:
  - > A network of 190 dedicated local country experts
  - > A web-based collaborative platform for efficient communication

#### Improve

##### Improve your machine ranges

- > Consulting

##### We improve your customer's machines in their production line

- > Audits
- > Retrofitting
- > Migration and upgrade
- > Training

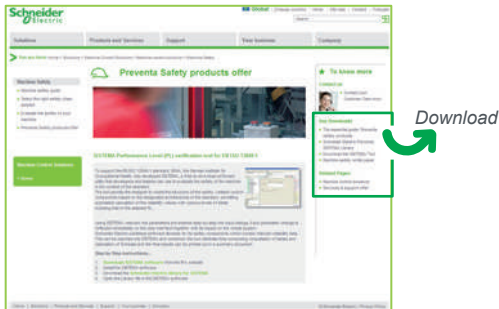

## Schneider Electric Library for SISTEMA

To support the EN/ISO 13849-1 standard, IFA, the German Institute for Occupational Health, has developed SISTEMA, a free-to-download software utility that designers and verifiers can use to evaluate the safety of the machine in the context of the standard.

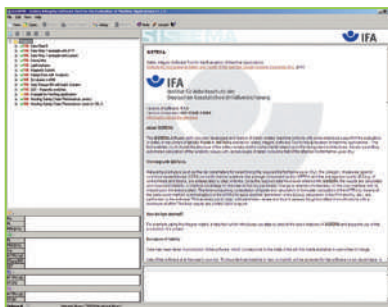

The tool permits the designer to model the structure of the safety-related control components based on the designated architectures of the standard, permitting automated calculation of the reliability values with various levels of detail, including that of the attained PL.

Using SISTEMA, relevant risk parameters are entered step-by-step into input dialogs. Each parameter change is reflected immediately on the user interface together with its impact on the whole system.

Schneider Electric publishes software libraries for its safety components which contain relevant reliability data. This can be imported into SISTEMA and combined, the two eliminate time-consuming consultation of tables and calculation of formulae and the final results can be printed out in a summary document.

Schneider Electric library for SISTEMA

SISTEMA software

### Industrial accidents

An industrial accident occurs through work or in the workplace and causes minor to serious injury to a person using a machine, feeding it or carrying out special work on it (fitter, operator, maintenance personnel, etc.).

#### Causes of accidents in the workplace

- > Human-related factors (designers, users):
  - > poor grasp of machine design
  - > over-familiarity with danger through habit and failure to take dangerous situations seriously
  - > underestimation of hazards, causing people to ignore safe working procedure
  - > loss of concentration on tasks to be performed (e.g. fatigue)
  - > failure to comply with procedures
  - > stressful working conditions (noise, work rates, etc.)
  - > uncertainty of employment which can lead to inadequate training
  - > inadequate or bad maintenance, generating unsuspected hazards
- > Machine-related factors:
  - > inadequate guards
  - > inherent machine hazards (e.g. reciprocal motion of a machine, unexpected starting or stopping)
  - > machines not suited to the application or environment (e.g. sound alarms deadened by the noise of surrounding machinery)
- > Plant-related factors:
  - > movement of personnel from machine to machine (automated production line)
  - > machinery from different manufacturers and using different technologies
  - > flow of materials or products between machines

#### Consequences

- > Risk of varying degrees of physical injury to the user
- > stoppage of the machine involved
- > stoppage of similar machine installations for inspection, for example by health and safety inspectors
- > if necessary, modifications to make machinery safe
- > change of personnel and training new personnel for the job
- > damage to the company brand image

#### Conclusion

Damages for physical injuries are equivalent to about 20 thousand million euro paid out each year in the European Union. Decisive action is required to reduce the number of accidents in the workplace. The first essentials are adequate company policies and efficient organisation. Reducing the number of industrial accidents and injuries depends on the safety of machines and equipment.

#### Types of potential hazard

The potential hazards of a machine can be classified into three main groups, as illustrated below:

#### Mechanical hazards

*Puncturing, cutting, shearing, fractures, severing*

*Catching, entanglement, drawing in, trapping*

*Impact*

*Crushing*

#### Electrical hazards

#### Physical and chemical hazards

*Electric shock, electrocution, burns*

*Discharge of dangerous substances*

*Burns*

### European legislation

**Safety has become a key issue for businesses. Social developments in association with technological progress have had a profound impact on legislation and on regulations for the use of building electrical automation equipment.**

#### Social issues

The safety-conscious nature of our western societies has led the legislature to increase the number of requirements and establish stricter rules, while the high cost of accidents has prompted companies to make efforts in the same direction.

#### Technological issues

Increasing levels of automation have led to new restrictions. In some cases it is difficult, if not dangerous, to stop a machine suddenly and it is necessary to perform a safe shut down sequence before allowing personnel to enter into a production cell. The increasingly widespread use of electronics and software has required a different approach to the solutions adopted; empirical rules are no longer enough. Selection includes a reliability calculation to determine the behavior of the system. In this context, the specification and design phase are crucial. Studies show that more than 2/3rds of incidents are due to bad design and inadequate specifications. At this stage it is therefore necessary to estimate potential risks and select the most appropriate solutions to reduce their consequences. Standards are available to assist and guide the designer.

Manufacturers of components and solutions help their customers by offering complete, ready-to-use functions which, when combined in accordance with the regulations, satisfy the customer's needs and meet legislative requirements. In this chapter, we will present a simplified process. To make a choice, the customer will then be able to refer to the safety functions chapter and to the safety products chapters.

European legislation requires that preventive action be taken to preserve and protect the quality of the environment and human health. To achieve these objectives, European Directives have been prepared which must be applied by plant operators and by manufacturers of equipment and machines. It also assigns responsibility for possible accidents.

- > Notwithstanding the constraints, machine safety has the following positive repercussions:
  - > prevention of industrial accidents
  - > protection of workers and personnel by means of suitable safety measures that take into account the machine's application and the local environment
- > This makes it possible to reduce direct and indirect related costs:
  - > by reducing physical harm
  - > by reducing insurance premiums
  - > by reducing production losses and possible delay penalties
  - > by limiting damages and costs for maintenance
- > Safe operation involves two principles: safety and reliability of the process:
  - > safety is the ability of a device to keep the risk incurred by persons within acceptable limits
  - > reliability of operation is the ability of a system or device to perform its function at any moment in time and for a specified duration
- > Safety must be taken into account right from the beginning of the design stage and kept in place throughout all stages of a machine's life cycle: transport, installation, commissioning, maintenance, dismantling

The main purpose of the Machinery Directive 2006/42/EC is to compel manufacturers to guarantee a minimum safety level for machinery and equipment sold within the European Union. This version has been replacing the 98/37/EC version since January 2010.

To allow free circulation of machinery within the European Union, the CE marking must be applied to the machine and an EC declaration of conformity is issued to the purchaser. This directive came into effect in January 1995 and has been enforced since January 1997 for all machines.

The user has obligations defined by the Use of Work Equipment directive 89/655/EEC which can in most cases be met by using machinery compliant with relevant standards.

These standards are complex. After a brief presentation of the structure of the standards system, we will provide the practical guide to the typical standards to be applied according to the selected control system design.

### Certification and CE marking

#### Certification and CE marking

There are 6 stages in the process for certification and affixing of the CE marking on machines:

- 1 Apply all the relevant directives
- 2 Conform to the essential health and safety requirements
- 3 Draw up the technical documentation
- 4 If applicable proceed with the conformity examination
- 5 Draw up the Declaration of Conformity
- 6 Affix the CE marking

#### The Machinery Directive

The Machinery Directive is an example of the “New approach” for the harmonization of products in terms of technical specifications and standards.

It is based on:

- > Essential health and safety requirements which must be complied with before the machine is put on the market
- > A voluntary harmonization process of standards undertaken by the European Standards Committee (CEN) and the European committee for electro-technical standardization (CENELEC)
- > Conformity of evaluation procedures adapted to the types of risk and associated with machine types
- > The CE marking, affixed by the manufacturer to indicate that the machine conforms to the applicable directives; machines bearing this marking can circulate freely within the European Union

The directive has considerably simplified the multiple national legislations which were in force and has therefore removed many barriers which made trading difficult in the European Union. This has also made it possible to reduce the social cost of accidents. The directives do not apply to pre-existing machines within the EU unless they are substantially modified. A list of the machines requiring special attestation procedures can be found in the Machinery Directive Annex 4.

#### The essential requirements

Annexe I of the Machinery Directive groups together the essential health and safety requirements, for putting machines and safety components on the market and into service in Europe.

It follows that:

- > If all the requirements of the directive are complied with, no member state of the European Union can oppose circulation of this product
- > If the requirements of the directive are not complied with, putting the product on the market may be prohibited or withdrawal of the product from the market may be required

In the European Union, this concerns not only manufacturers or their distributors, but also importers and resellers who import these machines or put them into service. Second-hand machines within the EU are not covered, but used machines that have been modified or refurbished can be considered to be new machines.

#### The harmonized standards

The simplest way to demonstrate conformity with the directives is to conform to the European Harmonized Standards. When, for a product listed in Annex 4 of the Machinery Directive, there is no harmonized standard, or the existing standards are not relevant to cover the essential health and safety requirements, or if the manufacturer considers that these standards are not applicable to their product, they can apply for approval by an outside Notified Body.

These bodies are approved by the Member States after having shown that they have the recognized expertise to give such an opinion (TÜV, BGIA, INRS, BSI Product Services, etc.).

Although the Notified Body has a certain number of responsibilities under the Directive, it is always the manufacturer or their representative who remain responsible for conformity of the product.

### Certification and CE marking (continued)

#### Declaration of conformity

In accordance with Article 1 of the Machinery Directive, the manufacturer or their authorized representative established in the European Union must draw up a European Declaration of Conformity for each machine (or safety component). This is in order to certify that the machine or safety component conforms to the Directive.

Before putting a product on the market, the manufacturer or their representative must prepare a technical file.

#### CE marking

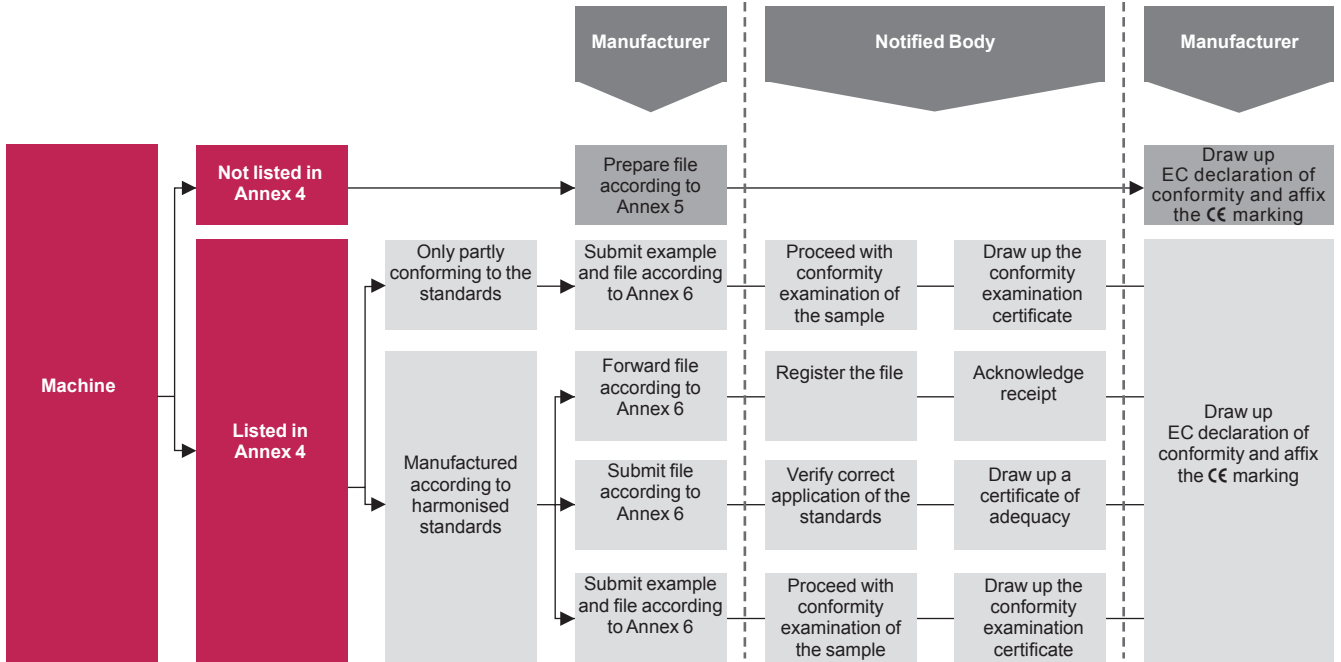

Finally, the CE mark must be affixed to the machine by the manufacturer or their authorized representative in the European Union. This marking has been obligatory since 1st January 1995 and can only be affixed if the machine conforms to all the applicable directives, such as:

- > The Machinery Directive 2006/42/ECC
- > The Electromagnetic Compatibility (EMC) directive 2004/108/EC
- > The Low Voltage Directive 2006/95/EC

There are other directives such as the protection of persons, lifts, medical equipment, etc., which may also be applicable.

The CE marking is the machine's passport in the European Union, which allows it to be marketed in all countries within the Union without taking into account regulations in each individual country.

#### CE marking procedure

### Standards

### Introduction

The harmonized European safety standards establish technical specifications which comply with the minimum safety requirements defined in the related directives. Compliance with all applicable harmonized European standards can be assumed to ensure compliance with the related directives. The main purpose is to guarantee a minimum safety level for machinery and equipment sold within the EU market and allow the free circulation of machinery within the European Union.

#### The 3 groups of European standards

- > **Type A** standards  
Basic safety standards which specify the basic concepts, design principles and general aspects valid for all types of machine: e.g. EN/ISO 12100
- > **Type B** standards  
Standards relating to specific aspects of safety or to a particular device that can be used on a wide range of machines
- > **Type B1** standards  
Standards relating to specific safety aspects of machines: e.g. EN/IEC 60204-1 Electrical equipment of machines
- > **Type B2** standards  
Standards relating to specific products such as two-hand control stations (EN 574), guard switches (EN 1088/ISO 14119), emergency stops (EN/ISO 13850), etc
- > **Type C** standards  
Standards relating to various families or groups of machines (e.g.: hydraulic presses EN 693, robots, etc) and giving detailed applicable requirements

A selection of standards		
Standards	Type	Subject
EN/ISO 12100	A	Machinery safety - General principles for design, risk assessment and risk reduction
EN 574	B	Two-hand control devices - Functional aspects and design principles
EN/ISO 13850	B	Emergency stop - Principles for design
EN/IEC 62061	B	Functional safety of safety-related electrical, electronic and electronic programmable control systems
EN/ISO 13849-1	B	Machinery safety - Safety-related parts of control systems - Part 1 General principles for design
EN/ISO 13849-2	B	Machinery safety - Safety-related parts of control systems - Part 2 Validation
EN 349	B	Minimum gaps to avoid crushing parts of the human body
EN 294	B	Safety distances to prevent hazardous zones being reached by upper limbs
EN 811	B	Safety distances to prevent hazardous zones being reached by lower limbs
EN/IEC 60204-1	B	Machinery safety - Electrical equipment of machines - Part 1: general requirements
EN 999/ISO 13855	B	Positioning of protective equipment in respect of approach speeds of body parts
EN 1088/ISO 14119	B	Interlocking devices associated with guards - Principles for design and selection
EN/IEC 61496-1	B	Electro-sensitive protective equipment
EN/IEC 60947-5-1	B	Electromechanical control circuit devices
EN 842	B	Visual danger signals - General requirements, design and testing
EN 1037	B	Prevention of unexpected start-up
EN 953	B	General requirements for the design and construction of fixed and movable guards
EN/IEC 61800-5-2	B	Adjustable speed electrical power drive systems. Part 5-2: Safety requirements – Functional
EN 201	C	Machinery for plastics and rubber - Injection moulding machines – Safety requirements
EN 692	C	Mechanical presses - Safety requirements
EN 693	C	Hydraulic presses - Safety requirements
EN 289	C	Machinery for plastics and rubber - Presses - Safety requirements
EN 422	C	Blow moulding machines for producing hollow parts - Design and construction requirements
EN/ISO 10218-1	C	Manipulating industrial robots - Safety requirements
EN 415-4	C	Safety of packaging machines - Part 4: palletisers and depalletisers
EN 619	C	Safety and EMC requirements for equipment for mechanical handling of unit loads
EN 620	C	Safety and EMC requirements for fixed belt conveyors for bulk material
EN 746-3	C	Industrial thermo processing equipment - Part 3: safety requirements for the generation and use of atmosphere gases

### Standards to be applied

### The process

**European Machinery Directive 2006/42/EC**  
 Compliance with the following standards ensure compliance with the Machinery Directive (this new version of the Machinery Directive 2006/42/EC has been replacing 98/37/EC since January 2010).

European Machinery Directive 2006/42/EC

**EN/ISO 12100: 2010:** General principles for design, risk assessment and risk reduction.  
 The purpose of this standard is to provide designers with an overall framework and guidance to enable them to produce machines that are safe for their intended use.

Machinery safety  
 General principles for design, risk assessment and risk reduction  
 EN/ISO 12100: 2010

**Standards** to be apply according to the design selected for the safety-related machine control system.

**Remarks:**  
 The use of either the EN/ISO 13849 or EN/IEC 62061 standards gives presumption of conformity to the new 2006/42/EC directive.

**EN/ISO 13849-1**  
**EN/ISO 13849-2**  
 Machinery safety  
 Safety-related parts of control systems

**EN/IEC 62061**  
 Machinery safety  
 Functional safety of safety-related electrical, electronic and programmable electronic control systems

**EN/IEC 60204-1:** Electrical equipment of machines  
 Standard EN/IEC 60204-1 completes the safety standards by giving setting-up rules for each component of a machine's electrical functions.  
 It specifies, amongst other things:

- > the type of connection terminals and disconnection and breaking devices
- > the type of electric shock protection
- > the type of control circuits
- > the type of conductors and wiring rules
- > the type of motor protection

Machinery safety  
 EN/IEC 60204-1  
 Electrical equipment of machines

### Standard to be applied according to the design selected for the safety related machine control system

**Safety standards to be applied according to type of architecture selected**  
 Based on the generic definition of the risk, the standards classify necessary safety levels in different discrete levels corresponding for each one to a probability of dangerous failure per hour:

- > PL (Performance Level) for standard EN/ISO 13849-1
- > SIL (Safety Integrity Level) for standard EN/IEC 62061

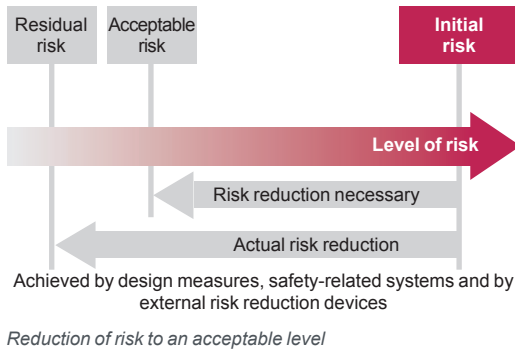

Certification and **CE** marking in accordance with the Machinery Directive

Standards to be applied for the design of machines

### Risk and safety

Safety is the absence of risks which could cause injury to or damage the health of persons. Functional safety is a part of safety that depends on the correct operation of safety functions.

According to the requirements of standard EN/ISO 12100: 2010, the machine designer's job is to reduce all risks to a value lower than the acceptable risk. For more details concerning the sources of accidents and risk prevention, the reader is referred on page 1/6.

This standard recognizes two sources of hazardous phenomena:

- > Moving transmission parts
- > Moving parts contributing to the work

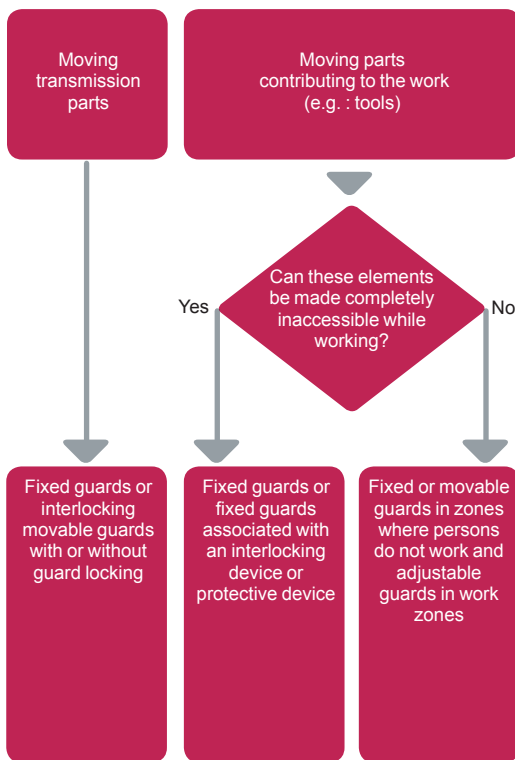

It gives guidelines for the selection and installation of devices which can be used to protect persons and identifies those measures that are implemented by the machine designer and those dependent on its user.

**The measures taken by the machine designer may be:**

- > Inherent in the design
- > Selection of guards and additional measures, including control systems
- > Information for the user

**The measures taken by the user may be (non-exhaustive list):**

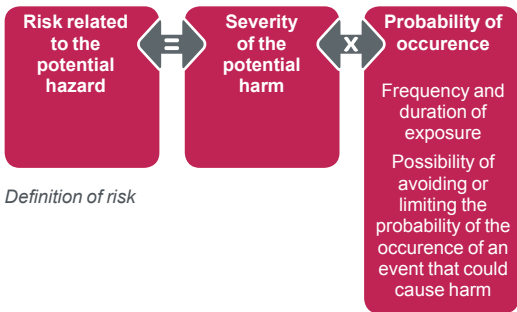

- > Organization, procedures, etc.
- > Personal protective equipment
- > Training

Selection of the protection system (EN/ISO 12100: 2010)

### Risk Assessment

Definition of risk

### Assessment of machinery related risk

#### European legislation

Machines are sources of potential risk and the Machinery Directive requires a risk assessment to ensure that any potential risk is reduced to less than the acceptable risk.

Standard EN/ISO 12100 defines risk as follows: risk is the severity multiplied by the possibility of occurrence. It defines an iterative process for achieving machine safety, which states that the risks for each potential hazard can be determined in four stages. This method provides the basis for the requisite risk reduction.

#### Risk assessment

- > Risk assessment consists of a series of logic steps which make it possible to systematically analyze and evaluate machinery-related risks
- > Risk assessment is followed, whenever necessary, by a reduction of the risk. This definition taken from standard EN/ISO 12100 is based on an iterative process represented in the diagram opposite

#### Determination of machine limits

Risk assessment starts by determining the limits of the machine at all stages of its life cycle:

- > Transport, assembly, installation
- > Commissioning
- > Use
- > De-commissioning, dismantling

The use limitations must then be specified:

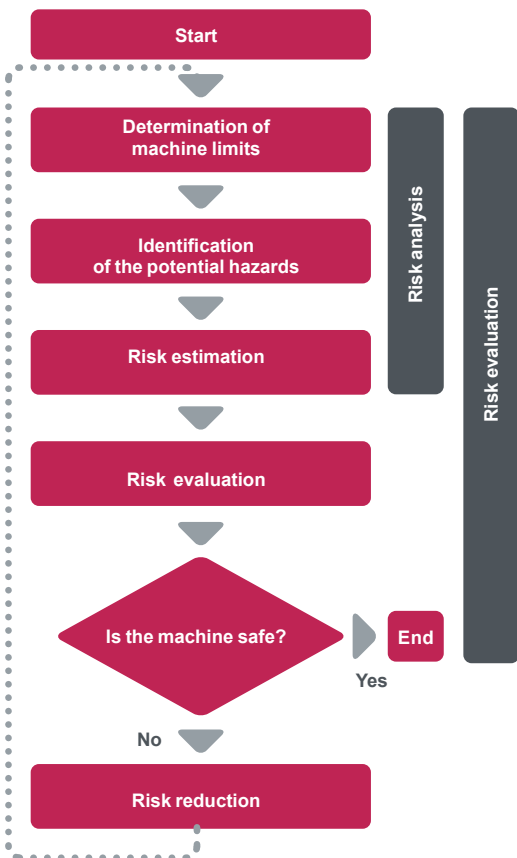

- > Operating modes
- > Level of training required
- > Space limits (amplitude, movement)
- > Time limits (life cycle, frequency of maintenance)

#### Identification of the potential hazard

If a potential hazard exists, a hazardous phenomenon will cause harm if measures are not taken.

All the tasks associated with the machine's life cycle must be identified, such as:

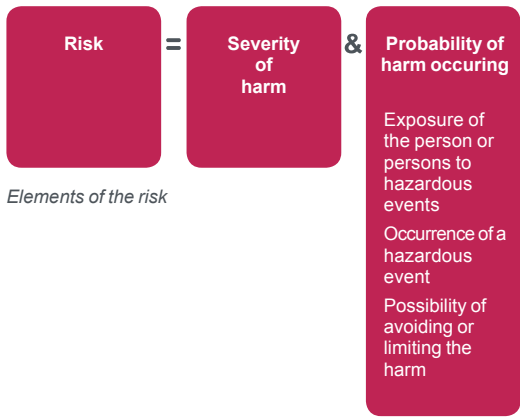

- > Assembly, transport and installation
- > Adjustment, testing
- > Learning, programming
- > Tool changing
- > Feeding, removal of product from the machine
- > Starting, stopping
- > Emergency Stops, restarting after an unexpected stop
- > Maintenance, cleaning, etc.

Logic steps for risk analysis

1

### Risk Assessment

### Risk estimation

The risk is a function of the severity of the harm and the probability that this harm will occur.

- > The severity of the harm takes into account:
  - > The severity of injuries (slight, serious, death)
  - > The extent of the harm (number of persons)
- > The probability of the harm occurring takes into account:
  - > Exposure to the hazard (nature of access, time spent in the hazardous zone, number of persons exposed, frequency of access, etc.)
  - > The occurrence of a hazardous event (accident history, comparison of risks, etc.)
  - > The possibility of avoiding or limiting the harm (experience, awareness of the risk, etc.)

### Risk assessment

On the basis of the risk assessment, the designer has to define the safety related control system.  
 To achieve that, the designer will choose one of the two standards appropriate to the application:

- > either standard EN/ISO 13849-1, which defines performance levels (PL)
- > or standard EN/IEC 62061, which defines safety integrity level (SIL)

- $\lambda$  rate of control system failures
- $\lambda_D$  rate of dangerous failures
- $\lambda_{DU}$  rate of undetected dangerous failures
- $\lambda_{DD}$  rate of detected dangerous failures
- $\lambda_S$  rate of safe failures
- $\lambda_{SU}$  rate of undetected safe failures
- $\lambda_{SD}$  rate of detected safe failures

Breakdown of the probability of failures

### Risk reduction

The process of risk reduction for dangerous events starts by:

- > Intrinsic prevention (inherently safe design)
- > Definition of the appropriate protective means (guards, carters, fix fences, etc.)
- > Personal training

If the selected preventive measure depends on a safety related control system, the designer has to perform an iterative process for the design of the safety relative control system.

- > The first stage is to define the necessary safety-related control functions:
  - > either through the choice of components
  - > or by adapting the control system architecture. Redundancy (double circuit components), for example, significantly increases the reliability of the solution
- > Once the limits of available technologies have been reached, it will not be possible to further reduce the rate of dangerous failures. To achieve the required level of safety, it will be necessary to use a diagnostic system that allows dangerous failures to be detected

**How to choose between EN/ISO 13849 and EN/IEC 62061**

**Select the applicable standard**

Based on the generic definition of the risk, the standards classify necessary safety levels in different discrete levels corresponding for each one to a probability of dangerous failure per hour:

- > PL (Performance Level) for standard EN/ISO 13849-1
- > SIL (Safety Integrity Level) for standard EN/IEC 62061

The table below gives the relationship between the performance level (PL) and the Safety Integrity Level (SIL).

PL	ISL	Probability of dangerous failures per hour 1/h
a	No correspondance	$\geq 10^{-5} \dots < 10^{-4}$
b	1	$\geq 3 \times 10^{-6} \dots < 10^{-5}$
c	1	$\geq 10^{-6} \dots < 3 \times 10^{-6}$
d	2	$\geq 10^{-7} \dots < 10^{-6}$
e	3	$\geq 10^{-8} \dots < 10^{-7}$

**Recommended application of IEC 62061 and ISO 13849-1**

Annex	Technology implementing the safety related control fuction (S)	ISO 13849-1	IEC 62061
A	Non electrical, e.g. hydraulics	X	Not covered
B	Electromechanical, e.g. relays, or non-complex electronics	Restricted to designated architectures (see Note 1) and up to PL=e	All architectures and up to SIL 3
C	Complex electronics, e.g. programmable	Restricted to designated architectures (see Note 1) and up to PL=d	All architectures and up to SIL 3
D	A combined with B	Restricted to designated architectures (see Note 1) and up to PL=e	X see Note 3
E	C combined with B	Restricted to designated architectures (see Note 1) and up to PL=d	All architectures and up to SIL 3
F	C combined with A, or C combined with A and B	X see Note 2	X see Note 3

"X" indicates that this item is dealt with by the standard shown in the column heading.

**Note 1** Designated architecture are defined in Annex B of EN/ISO 13849-1 to give a simplified approach for qualification of performance level

**Note 2** For complex electronics: use of designated architecture according to EN/ISO 13849-1 up to PL=d or any architecture according to EN/IEC 62061

**Note 3** For non-electrical technology use parts according to EN/ISO 13849-1 as subsystems.

For building specific complex sub-systems or for higher level requirements including software, standard EN/IEC 61508 relating to systems must be used.

1

**Standard EN/ISO 13849-1**  
Standards to be applied according to the design selected for the safety-related machine control system

### Introduction to Functional Safety of Machinery

The functional safety standards are intended to encourage designers to focus more on the functions that are necessary to reduce each individual risk, and on the performance required for each function, rather than simply relying on particular components. These standards make it possible to achieve greater levels of safety throughout the machine's life.

- > Under the previous standard, EN 954-1, categories (B, 1, 2, 3 and 4) dictated how a safety-related electrical control circuit must behave under fault conditions. Designers can follow either EN/ISO 13849-1 or EN/IEC 62061 to demonstrate conformity with the Machinery Directive. These two standards consider not only whether a fault will occur, but also how likely it is to occur
- > This means there is a quantifiable, probabilistic element in compliance: machine builders must be able to determine whether their safety circuit meets the required safety integrity level (SIL) or performance level (PL). Panel builders and designers should be aware that manufacturers of the components used in safety circuits (such as safety detection components, safety logic solvers and output devices like contactors) must provide detailed data on their products

### Standard EN/ISO 13849-1 Machinery safety - Safety-related parts of control systems

Standard EN/ISO 13849-1 is an evolution of standard EN 954-1.

#### Field of application of the standard

This standard gives safety requirements and advice relating to principles for the design and integration of safety-related parts of control systems (SRP/CS), including software design. For these parts, it specifies the characteristics, including the performance level, needed to achieve these safety functions. It applies to the SRP/CS of all types of machine, regardless of the technology and type of energy used (electric, hydraulic, pneumatic, mechanical, etc.).

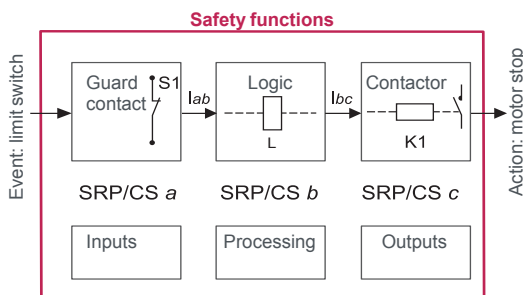

#### Process

Risk assessment as defined in standard EN/ISO 12100 leads to decisions on risk reduction measures.

If these measures depend on a control system, then EN/ISO 12100 can apply. It defines a **6-stage design process**:

- 1 - Selection of the essential safety functions that SRP/CS must perform. For each safety function, specify the required characteristics
- 2 - Determine the required performance level (PLr)
- 3 - Design and technical creation of safety functions: identify the parts that perform the safety function
- 4 - Evaluate the performance level PL for each safety-related part
- 5 - Check that the performance level PL achieved is greater than or equal to the required level (PLr)
- 6 - Check that all requirements are satisfied

We will now illustrate these stages, taking as an example a safety function where a severe injury can be caused by a trolley not stopping at the end of the Jib and thus causing the trolley to fall. A person can be exposed to this dangerous situation around the hoisting machine.

Representation of the safety function

#### Stage 1 - Selection of safety functions

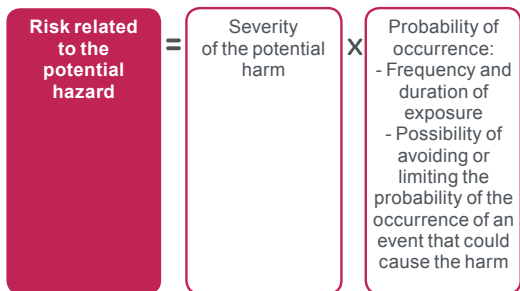

The diagram opposite shows a safety function which consists of several parts:

- > The input actuated by opening of the guard (SRP/CSa)
- > The control logic, limited in this example to opening or closing of a contactor coil (SRP/CSb)
- > The power output that controls the motor (SRP/CSc)
- > The connections (lab, lbc)

#### Stage 2 - Estimation of required performance level (PLr)

Considering our example of the person coming into area where the dangerous hoisting machine is operating we now estimate the risk using the risk graph. The parameters to be considered are:

- > **S** Severity of the injury
  - > **S1** Slight injury, normally reversible
  - > **S2** Serious, normally irreversible, including death
- > **F** Frequency and/or duration of exposure to the hazardous phenomenon
  - > **F1** Rare to fairly frequent and/or short duration of exposure
  - > **F2** Frequent to permanent and/or long duration of exposure
- > **P** Possibility of avoiding the hazardous phenomena or limiting the harm
  - > **P1** Possible under certain circumstances
  - > **P2** Virtually impossible

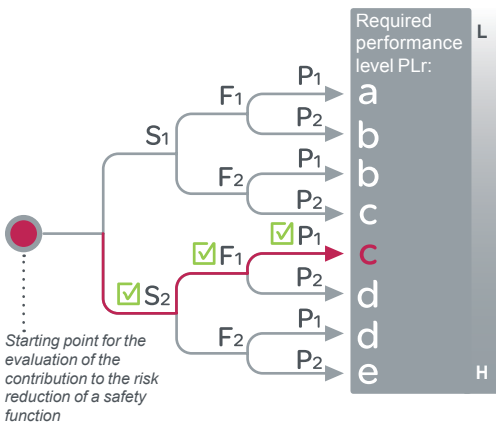

Risk analysis

**Standard EN/ISO 13849-1**  
**Machinery safety - Safety-related parts of control systems (continued)**  
**Process (continued)**

**Stage 2 - Estimation of required performance level (PLr) (continued)**

For our example: a serious injury S1 can be caused by being exposed near the hoisting machine as if there is no safe guarding to ensure the trolley stops the load and trolley will fall. After considering the severity of the injury we investigate the frequency and/or duration of the possible entry to the dangerous area. Here we define the frequency of exposure to the hazard is low F1 (occasional presence) as there are restrictions to enter the area. The last step is based upon the possibility to avoid the hazard and limiting the harm as the visibility around the dangerous machine is monitored by the operator and in this case there is a possibility to avoid the harm under certain conditions so we define it as P1.  
**The result of the estimation gives a required performance level PLr = c.**

Estimation of required performance level

- S = Severity of injury**
  - S1 = Slight (normally reversible injury)
  - ☑ S2 = Serious (normally irreversible) injury including death
- F = Frequency and/or exposure time to the hazard**
  - ☑ F1 = Seldom to less often and/or the exposure time is short
  - F2 = Frequent to continuous and/or the exposure time is long
- P = Possibility of avoiding the hazard or limiting the harm**
  - ☑ P1 = Possible under specific conditions
  - P2 = Scarcely possible
- L = Low contribution to risk reduction
- H = High contribution to risk reduction
- ➔ Estimation

**Stage 3 - Design and creation of the safety functions**

At this point, we need to describe the PL calculation method. For a SRP/CS (or a combination of SRP/CS), PL could be estimated with the figure shown on page 1/19, after estimation of several factors such as :  
 > Hardware and software system structure (categories)  
 > Mechanism of failures, diagnostic coverage (DC)  
 > Components reliability, Mean Time To dangerous Failure (MTTF<sub>d</sub>)  
 > Common Cause Failure (CCF)

> Categories (Cat.) and designated architectures

The table below summarises system behaviour in the event of a failure and the principles used to achieve the safety, for the 5 categories defined:

Cat.	System behaviour	Designated architectures
B	A fault can lead to loss of the safety function	
1	As for category B but the probability of this occurrence is lower than for the category B	
2	A fault can lead to loss of the safety function between two periodic inspections and loss of the safety function is detected by the control system at the next test.	
3	For a single fault, the safety function is always ensured. Only some faults will be detected. The accumulation of undetected faults can lead to loss of the safety function.	
4	When faults occur, the safety function is always ensured. Faults will be detected in time to prevent loss of the safety function	

- Key:
- im: Interconnecting means
  - c: Cross monitoring
  - I, I1, I2: Input device, e.g. sensor
  - L, L1, L2: Logic
  - m: Monitoring
  - O, O1, O2: Output device, e.g. main contactor
  - TE: Test equipment
  - OTE: Output of TE

> MTTF<sub>d</sub> (Mean Time To dangerous Failure)

The value of the MTTF<sub>d</sub> of each channel is given in 3 levels (see table below) and shall be taken into account for each channel (e.g. single channel, each channel of a redundant system) individually.

Reliability levels of components	
Index	Range
Low	3 years ≤ MTTF <sub>d</sub> < 10 years
Medium	10 years ≤ MTTF <sub>d</sub> < 30 years
High	30 years ≤ MTTF <sub>d</sub> < 100 years

A MTTF<sub>d</sub> of less than 3 years should never be found, because this would mean that after one year in operation, 30% of all those components in use would have failed to a dangerous state. The maximum value is limited to 100 years because devices dealing with a significant risk should not depend on the reliability of a single component. Additional measures such as redundancy and tests are required.

**Standard EN/ISO 13849-1**  
Standards to be applied according to the design selected for the safety-related machine control system

**Standard EN/ISO 13849-1**  
Machinery safety - Safety-related parts of control systems (continued)

**Process (continued)**

**Stage 3- (continued)**

> Diagnostic coverage (DC): this term is expressed as a percentage and quantifies the ability to diagnose a dangerous failure  
For example, in the event of welding of a N/C contact in a relay, the state of the N/O contact could incorrectly indicate the opening of the circuit, unless the relay has mechanically linked N/O and N/C contacts, when the fault can be detected.  
The standard recognises four levels:

**Diagnostic coverage (DC)**

Denotation	Range
Nil	DC < 60%
Low	60% ≤ DC < 90%
Medium	90% ≤ DC < 99%
High	99% ≤ DC

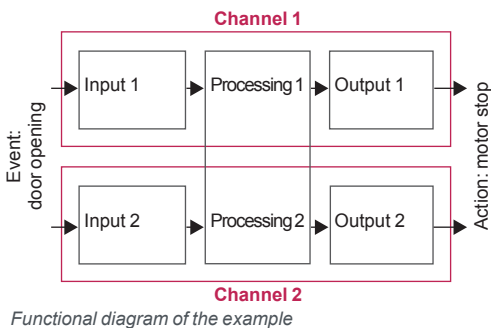

> Relationship between Categories, DC and MTTF<sub>d</sub> of each channel and the PL

> Using the above chart we can now select the most appropriate architecture, the required Diagnostic coverage as well as ensure the products selected have the right MTTF<sub>d</sub> values

> As we require PL= "c" the chart states as a minimum a category 1 architecture with a Diagnostic coverage of 0 (Nil) and a MTTF<sub>d</sub> of High is required. It is possible to use architectures with higher categories to solve the safety function needs

> We start with determining the architecture required to solve the function. We use the following Category 1 architecture (see page 1/19)

> In our example, to reach the PL = e, the solution will therefore have to correspond to category 4 with redundant circuit; the function scheme is shown opposite with two channels in parallel

> a high diagnostic capability

> a high MTTF<sub>d</sub>

For our application, we could suggest a redundant relay scheme but it is nowadays easier to use safety function blocks. The solution is illustrated below.

The process suggested by the standard is iterative and a few estimations are therefore necessary in order to obtain the expected result. In view of the required performance level, we have chosen a solution with redundant circuit.

**Standard EN/ISO 13849-1**  
**Machinery safety - Safety-related parts of control systems (continued)**  
**Process (continued)**

**Stage 4 - Evaluate the performance level PL for each safety-related part**  
 Based on the information in the supplier's catalogue and Annex E of the standard, we obtain the following values:

Example	B <sub>10</sub> (number of operations) / % dangerous failure	MTTF <sub>d</sub>	DC
SRP/CS <sub>a</sub> : Safety limit switches	10.000.000 / 20% dangerous failure	7102	99%
SRP/CS <sub>b</sub> : XPS AK safety module	-	154.5	99.99%
SRP/CS <sub>c</sub> : LCK contactor	1.000.000 / 73% dangerous failure	194	99%

For electromechanical products, the MTTF<sub>d</sub> is calculated on the basis of the total number of operations that the product can perform, using B<sub>10d</sub> values:  
 In our case, the machine operates for 220 days per year, 8 hours per day with a cycle of 90 s.

$N = 220 \times 8 \times (3600 / 90) = 70\,400$  operations/year  
 $MTTF_d = B_{10d} / (0.1 \times N)$  and  $B_{10d} = B_{10} / \% \text{ dangerous failure.}$

For the safety switches, the  $MTTF_d = (1 / 0.20 \times 10\,000\,000) / (0.1) \times 70\,400 = 7102$  years

For the contactors, the  $MTTF_d = (1 / 0.73 \times 1\,000\,000) / (0.1) \times 70\,400 = 194$  years

The MTTF<sub>d</sub> for each channel will then be calculated using the formula:

$$\frac{1}{MTTF_d} = \frac{1}{MTTF_{da}} + \frac{1}{MTTF_{db}} + \frac{1}{MTTF_{dc}}$$

i.e. 85 years for each channel.

A similar formula is used to calculate the diagnostic capability

$$DC_{avg} = \frac{\frac{DC_a}{MTTF_{da}} + \frac{DC_b}{MTTF_{db}} + \frac{DC_c}{MTTF_{dc}}}{\frac{1}{MTTF_{da}} + \frac{1}{MTTF_{db}} + \frac{1}{MTTF_{dc}}}$$

The result of the calculation in our example gives a value of 99%

**Stage 5 - Checking that required performance level is achieved**

The result of the above calculations is summarised below:

- > a redundant architecture: category 4
- > a mean time to failure > 30 years: high MTTF<sub>d</sub>
- > a diagnostic capability of 99%: high DC

Looking at this table, we confirm that PL level e is achieved:

Checking the PL

**Stage 6 - Validation of the required performance level**

The design of SRP/CS must be validated and must show that the combination of SRP/CS performing each safety function satisfies all the applicable requirements of EN/ISO 13849.

**Standard EN/IEC 62061**  
**Standards to be applied according to the design selected for the safety-related machine control system**

**Standard EN/IEC 62061**  
**Machinery safety - Safety-Related Electrical Control systems (SRECS)**

**Functional Safety of safety-related electrical, electronic and electronic programmable control systems**

**Field of application of the standard**

Safety-related electrical control systems in machines (SRECS) are playing an increasing role in ensuring the overall safety of machines and are more and more frequently using complex electronic technology.

This standard is specific to the machine sector within the framework of EN/IEC 61508. It gives rules for the integration of sub-systems designed in accordance with EN/ISO 13849. It does not specify the operating requirements of non-electrical control components in machines (for example: hydraulic, pneumatic).

**Functional approach to safety**

As with EN/ISO 13849-1, the process using the EN/IEC 62061 starts with analysis of the risks (EN/ISO 12100) in order to be able to determine the safety requirements.

**A particular feature of this standard is that it prompts the user to make a functional analysis of the architecture, then split it into sub-functions and analyse their interactions before deciding on a hardware solution for them (the SRECS).**

- > A functional safety plan must be drawn up and documented for each design project. It must include:
  - > A specification of the safety requirements for the safety functions (SRFC) that is in two parts:
    - > Description of the functions and interfaces, operating modes, function priorities, frequency of operation, etc.
    - > Specification of the safety integrity requirements for each function, expressed in terms of **SIL** (Safety Integrity Level)
  - > The structured and documented design process for electrical control systems (SRECS)
  - > The procedures and resources for recording and maintaining appropriate information
  - > The process for management and modification of the configuration, taking into account organisation and authorised personnel
  - > The verification and validation plan

> **Functional safety**

The decisive advantage of this approach is that of being able to offer a failure calculation method that incorporates all the parameters that can affect the reliability of electrical systems, whatever the technology used.

The method consists of assigning a SIL to each function, taking into account the following parameters:

- > The probability of a dangerous failure of the components (PFH<sub>d</sub>)
- > The type of architecture; with or without redundancy, with or without diagnostic device making it possible to avoid some of the dangerous failures
- > Common cause failures (power cuts, overvoltage, loss of communication network, etc.) (CCF)
- > The probability of a dangerous transmission error where digital communication is used
- > Electromagnetic interference (EMC)

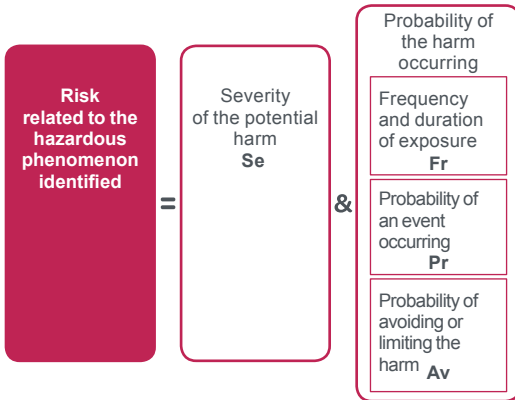

**Standard EN/IEC 62061**  
**Machinery safety - Safety-Related Electrical Control systems (SRECS) (continued)**  
**Process**

Designing a system is split into 5 stages after having drawn up the functional safety plan:

- 1 - Based on the safety requirements specification (SRS), assign a safety level (SIL) and identify the basic structure of the electrical control system (SRECS), describe each related function (SRCF)
- 2 - Break down each function into a function block structure (FB)
- 3 - List the safety requirements for each function block and assign the function blocks to the sub-systems within the architecture
- 4 - Select the components for each sub-system
- 5 - Design the diagnostic function and check that the specified safety level (SIL) is achieved.

**Stage 1 - Assign a safety integrity level (SIL) and identify the structure of the SRECS**

Based on the risk assessment performed in accordance with standard EN/ISO 12100, estimation of the required SIL is performed for each hazardous phenomenon and is broken down into parameters, see illustration opposite.

> Severity **Se**

The severity of injuries or damage to health can be estimated by taking into account reversible injuries, irreversible injuries and death.

The classification is shown in the table below:

Consequence	Severity <b>Se</b>
Irreversible: death, loss of an eye or an arm	4
Irreversible: shattered limb, loss of a finger	3
Reversible: requires the attention of a medical practitioner	2
Reversible: requires first aid	1

> Probability of the harm occurring

Each of the three parameters **Fr**, **Pr**, **Av** must be estimated separately using the most unfavourable case. It is strongly recommended that a task analysis model be used in order to ensure that estimation of the probability of the harm occurring is correctly taken into account.

> Frequency and duration of exposure **Fr**

The level of exposure is linked to the need to access the hazardous zone (normal operation, maintenance, ...) and the type of access (manual feeding, adjustment, ...). It must then be possible to estimate the average frequency of exposure and its duration.

The classification is shown in the table below:

Frequency of dangerous exposure	<b>Fr</b>
≤ 1 hour	5
>1 hour... ≤ 1 day	5
> 1 day... ≤ 2 weeks	4
2 weeks... ≤ 1 year	3
> 1 year	2

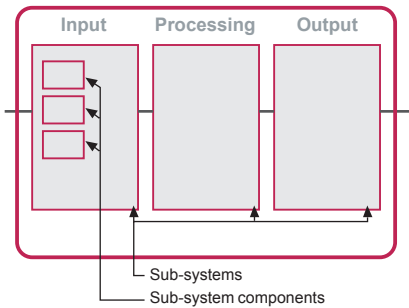

> Probability of occurrence of a hazardous event **Pr**.

Two basic concepts must be taken into account:

- > the predictability of the dangerous components in the various parts of the machine in its various operating modes (normal, maintenance, troubleshooting), paying particular attention to unexpected restarting
- > behaviour of the persons interacting with the machine, such as stress, fatigue, inexperience, etc.

Probability of occurrence of a dangerous event	<b>Pr</b>
Very high	5
Probable	4
Possible	3
Almost impossible	2
Negligible	1

**SRECS: Safety-related control system**

Stage 1: Basic structure of the electrical control system

1

**Standard EN/IEC 62061**  
Standards to be applied according to the design selected for the safety-related machine control system

**Standard EN/IEC 62061**  
Machinery safety - Safety-Related Electrical Control systems (SRECS) (continued)  
Process (continued)

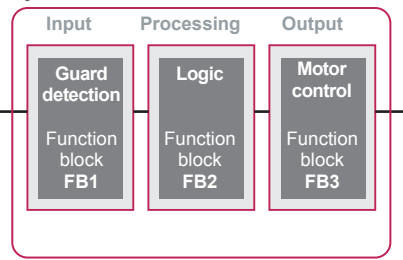

**Stage 1 -(continued)**  
> Probability of avoiding or limiting the harm Av  
This parameter is linked to the design of the machine. It takes into account the suddenness of the occurrence of the hazardous event, the nature of the dangerous component (cutting, temperature, electrical) and the possibility for a person to identify a hazardous phenomenon.

Probability of avoiding or limiting the harm	Av
Impossible	5
Almost impossible	3
Probable	1

> Assignment of the **SIL**  
Estimation is made with the help of the table below.  
In our example, the degree of severity is 3 because there is a risk of a finger being amputated; this value is shown in the first column of the table.  
All the other parameters must be added together in order to select one of the classes (vertical columns in the table below), which gives us:  
 > Fr = 5 accessed several times a day  
 > Pr = 4 hazardous event probable  
 > Av = 3 probability of avoiding almost impossible  
 Therefore a class CI = 5 + 4 + 3 = 12  
 A level of SIL 2 must be achieved by the safety-related electrical control system(s) (SRECS) on the machine.

Se	Class CI				
	3-4	5-7	8-10	11-13	14-15
4	SIL 2	SIL 2	SIL 2	SIL 3	SIL 3
3	-	-	SIL 1	SIL 2	SIL 3
2	-	-	-	SIL 1	SIL 2
1	-	-	-	-	SIL 1

**SRECS**  
Objective SIL 2

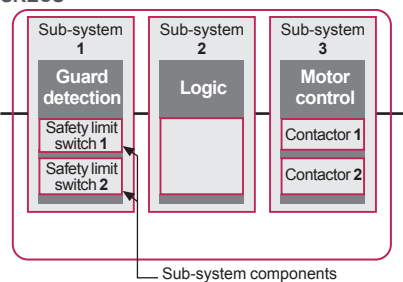

Stage 2: Break down into function blocks

> Basic structure of the **SRECS**  
Without going into detail about the hardware components to be used, the system is broken down into sub-systems. In our case, we find the 3 sub-systems that will perform the input, processing and output functions. The figure opposite illustrates this stage, using the terminology given in the standard.

**Stage 2 - Break down each function into a function block structure (FB)**  
A function block (FB) is the result of a detailed break down of a safety-related function.  
The function block structure gives an initial concept of the SRECS architecture. The safety requirements of each block are deduced from the specification of the safety requirements of the system's function.

**SRECS**

Stage 3: Assignment of function blocks

**Stage 3 - List the safety requirements for each function block and assign the function blocks to the sub-systems within the architecture**  
Each function block is assigned to a sub-system in the SRECS architecture. A failure of any sub-system will lead to the failure of the safety-related control function. More than one function block may be assigned to each sub-system. Each sub-system may include sub-system elements and, if necessary, diagnostic functions in order to ensure that anomalies can be detected and the appropriate action taken.  
These diagnostic functions (D) are considered as separate functions; they may be performed within the sub-system, by another internal or external sub-system.

**Standard EN/IEC 62061**  
**Machinery safety - Safety-Related Electrical Control systems (SRECS) (continued)**  
**Process (continued)**

**Stage 4 - Select the components for each sub-system**

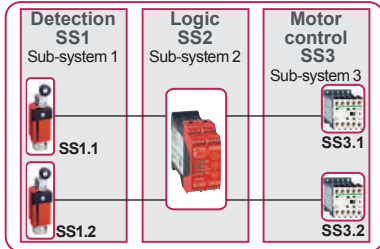

The products shown in the illustration opposite are selected. If the sensors and contactors are the same as in the previous example, a safety module XPS AK will be chosen. In this example, we take a cycle of 450s which means the duty cycle C is 8 operations per hour.

As the safety integrity level required for the entire system is SIL 2, each of the components must achieve this level.

The manufacturer's catalogue gives the following values:

Safety limit switches 1 and 2:  $B_{10} = 10\ 000\ 000$  operations, the proportion of dangerous failures is 20%, lifetime is 10 years.

- > Safety module:  $PFH_d = 7.389 \cdot 10^{-9}$
- > Contactors 1 and 2:  $B_{10} = 1\ 000\ 000$  operations, the proportion of dangerous failures = 73%, lifetime is 20 years

Stage 4: Component selection

**Stage 5 - Design the diagnostic function**

The SIL of the sub-system depends not only on the components, but also on the architecture selected. For our example, we will choose architectures B and D of the standard.

In our architecture, the safety module performs diagnostics not only on itself, but also on the safety limit switches.

We have three sub-systems for which the safety levels must be determined:

- > SS1: two redundant safety limit switches in a sub-system with a type D architecture
- > SS2: a SIL 3 safety module (obtained on the basis of the PFH provided by the manufacturer)
- > SS3: two redundant contactors built in accordance with a type B architecture

The calculation method can be found in the machine safety guide, so we will only give the final result. This method takes into account the following parameters:

- >  $B_{10}$ : number of operations at which 10% of the population fail
- > C: Duty cycle (number of operations per hour)
- >  $\lambda_D$ : rate of dangerous failures ( $\lambda_D = \lambda \times$  portion of dangerous failures in %)
- >  $\beta$ : common cause failure coefficient, which is 10% here and 10% is the worst case: see Annex F
- > T1: Proof Test Interval or life time whichever is smaller, as provided by the supplier
- > T2: diagnostic test interval
- > DC: Diagnostic coverage rate =  $\lambda_{DD}/\lambda_D$ , ratio between the rate of detected failures and the rate of dangerous failures

We obtain:

- > for SS1  $PFH_d = 1.6 \cdot 10^{-9}$
- > for SS3  $PFH_d = 1.06 \cdot 10^{-7}$

The total probability of dangerous failures per hour is:

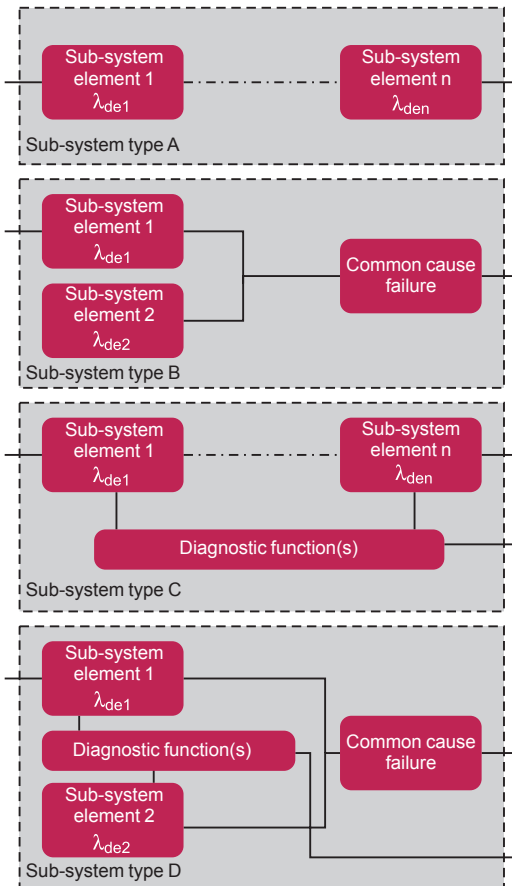

- >  $PFH_{DSRECS} = PFH_{DSS1} + PFH_{DSS2} + PFH_{DSS3}$
- >  $PFH_{DSRECS} = 1.6 \cdot 10^{-9} + 7,38 \cdot 10^{-9} + 1.06 \cdot 10^{-7} = 1.15 \cdot 10^{-7}$

Which corresponds to the expected result (table below) of a SIL = 2 .

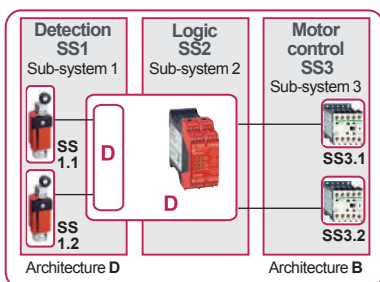

Comment: A level of SIL 3 could have been achieved by using mirror contacts to create a feedback loop on the contactors, i.e. a sub-system architecture type D.

**Checking the required SIL**

SIL	Probability of dangerous failures per hour (PFHd)
3	$\geq 10^{-8} \dots < 10^{-7}$
2	$\geq 10^{-7} \dots < 10^{-6}$
1	$\geq 10^{-6} \dots < 10^{-5}$

Types of sub-system architecture

Stage 5: Design of the diagnostic function

### Emergency Stop with Embedded Safety Module

Emergency Stop Pushbutton / Contactor  
Cat.3 PL d, SIL 2 / Stop Category 0

#### Related Products

- Switches, pushbuttons, emergency stop - Harmony XB4
- Switch mode Power supply - Phaseo ABL8
- Safety Module - Modicon TM3SAC5R(G)
- Safety switches - Preventa XCS
- Contactor - TeSys D
- Modular beacon and tower light - Harmony XVB

#### Function

Safety-related stop function initiated by Emergency stop push button to minimize the consequences of possibly harmful event.

The pushing of emergency stop push button is detected from opening contacts, which are checked by the safety module.

Opening these contacts causes the deactivation of the safety module outputs (stop category 0 according to EN/IEC 60204-1), which results in a switch-off of the motor power supply to minimize hazard in case of emergency by means of the contactors (K1 and K2).

#### Typical applications

- > Machine-tools or similar machines with low inertia (no rundown time), where the access to the hazardous area is limited to maintenance interventions

Emergency Stop with Embedded Safety Module  
Emergency Stop Pushbutton / Contactor

Safety-related stop function initiated by Emergency stop push button to minimize the consequences of possibly harmful event.

The pushing of emergency stop push button is detected from opening contacts, which are checked by the safety module.

Opening these contacts causes the deactivation of the safety module outputs (stop category 0 according to EN/IEC 60204-1), which results in a switch-off of the motor power supply to minimize hazard in case of emergency by means of the contactors (K1 and K2).

The main contactors are monitored by the safety module to detect e.g. contact welding, by means of their mirror contacts.

#### Typical applications

- > Machine-tools or similar machines with low inertia (no rundown time), where the access to the hazardous area is limited to maintenance interventions

Emergency Stop with Embedded Safety  
PLC  
Emergency Stop Push Button / PacDrive 3  
Drive  
Cat.4 PL e, SIL 3 / Stop Category 0

#### Related Products

- PacDrive 3
- Harmony XVB

#### Function

Safety-related stop function initiated by any stop or emergency stop command to halt the machine and to unlock the moveable guard that prevents the access to the hazardous area before the machine comes to a standstill.

Emergency stop command is detected by using an emergency stop push button in positive actuation mode, which are then checked by the safety PLC allowing detection of the opening contacts.

Actuation of the emergency stop or stop contacts initiates the functional stopping of the machine by cutting-off torque from the motor. As electric motors run down, a remanent voltage is produced in the windings of the motor due to residual magnetism. This voltage is measured so as to detect the stopped condition of the motor, providing the unlock signal for the electrically locked moveable guard and for engaging brakes after the motor has come to a standstill.

The continuity of the wiring between the motor windings and the inputs of the safety modules are also monitored to prevent a cable breakage or fault being seen as a stopped motor.

#### Typical applications

- > Machine tools, robots, production test equipment, test benches
- > Papermaking machines, textile production machines, calendars in the rubber industry
- > Process lines in plastics, chemicals or metal production, rolling-mills
- > Cement crushing machines, cement kilns, mixers, centrifuges, extrusion machines
- > Drilling machines
- > Conveyors, materials handling machines, hoisting equipment (cranes, gantries, etc.)
- > Pumps, fans, etc.

**Guard Monitoring with Safety Module**  
**Limit switch / Contactor**  
**Cat.3 PL d, SIL 2 / Stop Category 0**

- Safety Module - Preventa XPSAV
- Coded magnetic switches - Preventa XCSDM
- Variable speed drive - Altivar 32
- Modular beacon and tower lights -Harmony XVB
- Switch mode Power supply - Phaseo ABL8

#### Function

Safety-related stop function initiated by a moveable guard that helps protecting from the access to the hazardous area.

Controlled stopping with power maintained to the actuator (drive) to achieve stopping (i.e. braking), then cut-off of power when standstill is reached (Safe Stop 1). The hazardous movement is interrupted either if the stop button (S2) or the emergency stop device (S3) is actuated.

Opening of this guard is detected by a magnetic switch, which initiates the functional stopping of the drive, i.e. by a braking ramp (stop category 1 in accordance with EN/IEC 60204-1).

After the delay time monitored by the safety module has elapsed, the safety delayed outputs are deactivated. The drive is then halted, by the "safe torque off" (STO) safety function integrated within it, which prevents the motor from restarting unintentionally.

The switching of the STO and LI3 input is monitored by the drive. The power stage is disabled if the time offset is exceeded. The motor can no longer generate torque and coasts down without braking.

The safety module also monitors the consistent actuation of the redundant coded magnetic switch contacts to detect possible failure, before restart of the machine movement is permitted.

#### Typical applications

- > Machines that use drives in their movements due to high speed and precision needed (i.e. textile, wood-working or simple packaging machines), when the delayed initiation of the stopping in the event of a fault must not involve an unacceptably high residual risk

Guard Monitoring with Safety Module

#### Function

Safety-related stop function initiated by a moveable guard that helps protecting from the access to the hazardous area.

Controlled stopping with power maintained to the actuator (drive) to achieve stopping (i.e. braking), then cut-off of power when standstill is reached (Safe Stop 1). The hazardous movement is interrupted either if the stop button (S2) or the emergency stop device (S3) is actuated. (\*)

Opening of this guard is detected by a safety guard switch, which initiates the functional stopping of the drive, i.e. by a braking ramp (stop category 1 in accordance with EN/IEC 60204-1).

After the delay time monitored by the safety module has elapsed, the safety delayed outputs are deactivated. The drive is then halted, by the "safe torque off" (STO) safety function integrated within it, which prevents the motor from restarting unintentionally.

The safety module also monitors the consistent actuation of the redundant guard switch contacts to detect possible failure, before restart of the machine movement is permitted.

(\*) The function for stopping in an emergency is a protective measure which complements the safety functions for the safeguarding of hazardous zones according to EN/ISO 12100-2.

#### Typical applications

- > Machines that use drives in their movements due to high speed and precision needed (i.e. stacker-cranes used on automatic storage and retrieval systems), when the delayed initiation of the stopping in the event of a fault must not involve an unacceptably high residual risk

Guard Monitoring with Safety Module  
Coded Magnetic Switch / Servo Drive  
Cat.3 PL d, SIL 2 / Stop Category 1

#### Related Products

- Switches, pushbuttons, emergency stop - Harmony XB4
- Switch mode Power supply - Phaseo ABL8
- Coded magnetic system - Preventa XCSDM
- Safety Module - Preventa XPSAV
- Servo Drive - Lexium 32
- Modular beacon and tower lights - Harmony XVB

#### Function

Safety-related stop function initiated by any of the moveable guards that helps protecting from the access to the hazardous area.

Controlled stop with power available to the actuators (servo-drive) to achieve the stop (i.e. by controlled braking). Power is not interrupted until the stop is achieved (Safe Stop 1).

After activating the function, the servo motor is braked in a controlled manner, maintaining the power on the actuators. The power is then cut after the machine has come to a halt.

Opening of a guard is detected by a coded magnetic switch system that activates via the safety module the "Halt" function on the servo-drive; any active movement is decelerated via the adjusted ramp.

After the delay time monitored by the safety module has elapsed, the safety delayed outputs (stop category 1 in accordance with EN/IEC 60204-1) are deactivated. The servo-drive power stage is then disabled, via the "safe torque off" (STO) safety function integrated within it, which prevents the servo-motor from restarting unintentionally.

The switching of the two redundant STO inputs is monitored by the servo-drive. The power stage is disabled and an error message is generated if the time offset (< 1 sec) is exceeded. The servo-motor can no longer generate torque and coasts down without braking.

The safety module also monitors the consistent actuation of the magnetic switch contacts to detect possible failure, before restart of the machine movement is permitted.

Opening or removal of the protective guard is detected by means of the coded magnetic switch system, which are particularly usable for guards without accurate guidance and for use in difficult environments (dust, liquids, etc.).

#### Typical applications

- > Packaging, printing, or similar machines that use servo-drives in their movements due to high speed and precision needed, on which non-braking stopping would result in a impermissibly long run-down of the hazardous tool movements

Guard Monitoring with Safety Module  
Guard switch / Contactor

#### Function

Safety-related stop function initiated by a moveable guard that helps preventing access to the hazardous area.

Controlled stopping with power maintained to the actuator (drive) to achieve stopping (i.e. braking), then cut-off of power when standstill is reached (Safe Stop 1). The hazardous movement is interrupted either if the stop button or the emergency stop device is actuated. Opening of this guard is detected by limit switches, which initiates the functional stopping of the drive, i.e. by a braking ramp (stop category 1 in accordance with EN/IEC 60204-1).

After the delay time monitored by the drive has elapsed, drive halts itself, by the "safe torque off" (STO) safety function integrated within it, which prevents the motor from restarting unintentionally. The switching of the STO and input is monitored by the drive. When the motor can no longer generate torque, the safety PLC is notified and it can provide the unlock signal for the electrically locked movable guard or engaging brakes.

The safety module also monitors the consistent actuation of the redundant limit switch contacts to detect possible failure, before restart of the machine movement is permitted.

#### Typical applications

- > Machine tools, robots, production test equipment, test benches
- > Papermaking machines, textile production machines, calendars in the rubber industry
- > Process lines in plastics, chemicals or metal production, rolling-mills
- > Cement crushing machines, cement kilns, mixers, centrifuges, extrusion machines

- Servo drive - Lexium 32M
- Human machine interface - Magelis XBT GH
- Modular beacon and tower lights - Harmony XVB
- Switch mode Power supply - Phaseo ABL8

#### Function

Safety-related stop function realized by a moveable guard that helps protecting from the access to the hazardous area.

The hazardous movement is interrupted either if the stop button (S2) or the emergency stop device (S3) is actuated, which initiates the functional stopping of the servo-drive, i.e. by a deceleration ramp.

The Safe Stop 2 safety function is used to achieve a category 2 safe stop in accordance with EN/IEC 61800-5-2, where the servo motor is braked in a controlled manner, maintaining the power on the actuators.

The safety function SS2 (Safe Stop 2), integrated in the enhanced safety module (eSM) card, monitors the deceleration and the standstill position.

When the SS2 function is triggered, a deceleration of movement is monitored with the specified monitoring ramp up to standstill. The motor is then immobilized by the "safe operating stop" (SOS) function, which is used to monitor any deviation from the standstill position.

If the monitored deceleration ramp is violated or the monitored standstill position is not maintained, the drive is halted by the "safe torque off" (STO) function, which prevents the motor from restarting unintentionally.

The eSM card also monitors the consistent actuation of the redundant switch contacts from the magnetic switch to detect possible failure, before restart of the machine movement is permitted.

#### Typical applications

- > Packaging, printing, or similar machines that use servo-drives in their movements due to high speed and precision needed, on which non-braking stopping would result in a impermissibly long run-down of the hazardous tool movements

2

**Guard Monitoring with Well Tried Components**  
**Limit Switch / Motor Starter**  
**Cat.3 PL c, SIL 1 / Stop Category 0**

**Related Products**

- Switches, pushbuttons, emergency stop - Harmony XB4
- Emergency stop function - Harmony XALK
- Switch mode Power supply - Phaseo ABL8
- Motor starter - TeSys U
- Safety Guard switches - Preventa XCS
- Modular beacon and tower lights - Harmony XVB

**Function**

Stop function initiated by a moveable protective guard. Opening of this guard is detected by a guard switch, which interrupts the control voltage of the motor starter (stop category 0 according to EN/IEC 60204-1) to help preventing possible hazardous movements. The break contact of this guard switch interrupts the control circuit directly when the protective guard is not in the safe position. The motor is also de-energized when either of the emergency stop devices (S1 or S2) are actuated.(\*)  
 The safety function is fully dependent upon the reliability of the components.

(\* ) The function for stopping in an emergency is a protective measure which complements the safety functions for the safeguarding of hazardous zones according to EN/ISO 12100-2.

**Typical applications**

- > Machine-tools or similar machines with low inertia (no rundown time), where the access to the hazardous area is limited to maintenance interventions

Enabling movement with Safety Controller  
Two Hand Control Station / Contactor  
Cat.4 PL e, SIL 3 / Stop Category 0

- Safety Controller - Preventa XPS MC
- Contactor - TeSys D
- Modular beacon and tower light - Harmony XVB

#### Function

Safety-related function to help control the location of the operator's hands outside the hazardous area during a hazardous movement of the machine.

To initiate a movement, both actuators (two-hand control pushbuttons S3 and S4) must be activated synchronously (within an interval less than 0,5 sec.) to energize the contactors (K1 and K2). When at least one of the two pushbuttons is released, the energization is cancelled and remains blocked until both pushbuttons are released and pressed again synchronously.

The logic device (Safety Controller) monitors operation of the actuators (pushbuttons). Faults in the actuating mechanism as well as the cable wiring are detected in S3/S4 by the use of two contacts employing a normally open (NO) and normally closed (NC) combination.

Faults in K1/K2 (with mirror contacts) are detected in the safety controller and lead to de-energization of the contactors (K1 and K2).

#### Typical applications

- > Hydraulic, eccentric press or similar complex machines with 4 or more safety functions included, where a centralized safety controller would be required

Speed Monitoring with Safety Module  
 Remanent Voltage detection and limit  
 switch and Guard switch with lock /  
 Contactor

- Modular beacon and tower lights - Harmony XVB

#### Function

Safety-related stop function initiated by any stop or emergency stop command to halt the machine and to unlock the moveable guard that prevents the access to the hazardous area before the machine comes to a standstill. Guard opening is detected by using a solenoid locking guard switch in combination with a limit switch in positive actuation mode, which are then checked by the safety module allowing detection of the opening or removal of the protective guard. Actuation of the emergency stop or stop contacts initiates the functional stopping of the machine by switching-off the motor power supply. As electric motors run down, a remanent voltage is produced in the windings of the motor due to residual magnetism. This voltage is measured so as to detect the stopped condition of the motor, providing the unlock signal for the electrically locked movable guard and for engaging brakes after the motor has come to a standstill. The continuity of the wiring between the motor windings and the inputs of the safety module is also monitored to prevent a cable breakage or fault being seen as a stopped motor. The main contactors are monitored by the safety modules by means of the mirror contacts to detect e.g. contact welding. The safety modules also monitor the consistent actuation of the limit switch contacts to detect failure, before restart of the machine movement is permitted.

#### Typical applications

- > On metal, wood work or similar high inertia machines with a long run-down of the hazardous tool movements, and where an electronically interlock guard is used to protect the hazardous area

### Speed Monitoring with Embedded Safety PLC

Selector Switch / PacDrive 3 Drive  
Cat.4 PL e, SIL 3 / Safe Limited Speed

#### Related Products

- Switches, pushbuttons, emergency stop - Harmony XB4
- Switch mode Power supply - Phaseo ABL8
- Preventa Safety PLC TM5SLC●● (TM5 Slices> SPS, SDIO, BC)
- Safety switches - Preventa XCS
- PacDrive 3
- Harmony XVB

#### Function

Safety-related Speed monitoring function initiated by a safe command to control the machine and to unlock the moveable guard that prevents the access to the hazardous area before the machine comes to a safe speed.

Selector switch status change is detected by using a selector switch or standard PLC signal for change in operating mode, which are then checked by the safety PLC allowing detection of the change in operating mode of the machine.

Actuation of the selector switch or standard PLC signal initiates the control rampdown of the machine by drive controller. As electric motors run down, monitored by built in encoder, then speed will be continuously monitored. If at any time the speed of the motor exceeds the specified limit, SS1 or STO function is initiated for monitored stop or free whiling stop.

The continuity of the wiring between the motor windings and the inputs of the safety modules are also monitored to prevent a cable breakage or fault being seen as a stopped motor.

The safety modules also monitor the consistent actuation of the limit switch contacts to detect failure, before restart of the machine movement is permitted.

#### Typical applications

- > Machine tools, robots, production test equipment, test benches
- > Papermaking machines, textile production machines, calendars in the rubber industry
- > Process lines in plastics, chemicals or metal production, rolling-mills
- > Cement crushing machines, cement kilns, mixers, centrifuges, extrusion machines
- > Drilling machines
- > Conveyors, materials handling machines, hoisting equipment (cranes, gantries, etc.)
- > Pumps, fans, etc.

Position Monitoring with Embedded Safety PLC  
 Limit Switch / PacDrive 3 Drive  
 Cat.4 PL e, SIL 3 / Stop Category 2

2

- Switch mode Power supply - Phaseo ABL8
- Safety Module - Preventa XPSAK
- Safety Mats - Preventa XY2TP
- Contactor - Tesys D
- Modular beacon and tower lights - Harmony XVB

#### Function

Safety-related stop function initiated by any of the safety mats installed around the different potentially hazardous zones defined by the dangerous movement of the machine.

The hazardous movement is interrupted either if the emergency stop device (S1) or any of the safety mats (SM1 or SM2) is actuated.

Stepping on the safety mat deactivates the safety module outputs, which results in the switching-off of the motor power supply by means of the contactors K1 and K2 (stop category 0 in accordance with EN/IEC 60204-1) in order to prevent possible hazardous movements or states.

The safety mat provides a protection zone between machine operator and any dangerous movements and enables free access for the loading and unloading of the machine.

The safety module monitors the consistent actuation of the redundant safety mat contacts to detect possible failures.

The main contactors are also monitored by the safety module by means of the mirror contacts, to detect contact welding.

The resetting of the function can be performed manually or automatically, depending on the configuration of the safety module, before renewed start-up of the machine movement. (\*)

(\*) The function for stopping in an emergency is a protective measure which complements the safety functions for the safeguarding of hazardous zones according to EN/ISO 12100-2.

#### Typical applications

- > Machines which use a free and very frequent access to the hazardous area, where a high number of interventions are needed

Perimeter Guarding with Safety Module  
Single Beam Light curtains / Contactor  
Cat.3 PL c, SIL 1 / Stop Category 0

2

- Photo-electric sensors - OsiSense XU
- Safety Module - Preventa XPSCM
- Contactor - Tesys D
- Modular beacon and tower lights - Harmony XVB

### Function

Safety-related stop function initiated by several single-beam photo-electric devices used as protective equipment (ESPE Type 2 according to EN/IEC 61496-1 and EN/IEC 61496-2).

An interruption of the detection field causes the safety outputs to open. The deactivation of the safety outputs results in the switching-off of the motor power supply by means of the contactor (K1) to help to prevent possible hazardous movements or states. The photo-electric devices (B1...B4) are cyclically tested and monitored by the safety module to detect possible failures.

A muting function can be enabled by means of photo-electric sensors (A1, A2). It allows the light curtain's detection function to be temporarily inhibited without triggering the stop function.

During the muting time interval, materials can be transported through the hazardous area and the muting indicator light (H1) indicates to the operator this temporary disabling of protection.

### Typical applications

- > Palletizing stations with automatic control system where pallets would pass frequently through the hazardous area

### Perimeter Guarding with Embedded Safety Module

Light curtain / Contactor

Cat.4 PL e, SIL 3 / Stop Category 0

**Function**

Safety-related stop function initiated by a safety light curtain (ESPE Type 4 according to EN/IEC 61496-1 and EN/IEC 61496-2). Controlled stopping with power maintained to the drive to achieve stopping (i.e. braking), then cut-off of power when standstill is reached (Safe Stop 1). The hazardous movement is interrupted either if the stop button (S2) or the emergency stop device (S3) is actuated. An interruption of the detection field initiates the functional stopping of the drive, i.e. by a braking ramp (stop category 1 in accordance with EN/IEC 60204-1). After the delay time monitored by the drive has elapsed, the drive is halted, by the “safe torque off” (STO) safety function integrated within it, which prevents the motor from restarting unintentionally. The switching of the LI3 input is monitored by the drive. The power stage is disabled when the time offset is exceeded.

**Typical applications**

- > Machines that use drives in their movements due to high speed and precision needed (i.e. textile, wood-working or simple packaging machines), when the delayed initiation of the stopping in the event of a fault must not involve an unacceptably high residual risk

### Emergency stop

### Explanation of function

2

International standard EN/ISO 13850 (replaces standard EN 418) specifies the functional requirements and design principles of emergency stop devices.

**Stop types:**

Stop category 0 and/or stop category 1 and/or stop category 2 stop functions shall be provided as indicated by the risk assessment and the functional requirements of the machine:

**Stop Category 0:**

Stopping by immediate removal of power to the machine actuators (i.e. an uncontrolled stop – stopping of machine motion by removing electrical power to the machine actuators)

**Stop Category 1:**

A controlled stop (stopping of machine motion with electrical power to the machine actuators maintained during the stopping process) with power available to the machine actuators to achieve the stop and then removal of power when the stop is achieved

**Stop Category 2:**

A controlled stop with power left available to the machine actuators

Stop category 0:  
Emergency stop function

Stop category 1

For the Emergency stop function either Stop Category 0 or Stop Category 1 is chosen according to the risk assessment results.

It applies to all machines, whatever type of energy is used to control this function. When the emergency stop instruction ceases, the effect must be maintained until it is reset. Manual resetting must only be possible in the location where the instruction was given. Resetting must not start the machine, but simply enable the starting cycle.

Restarting of the machine must not be possible until the emergency stop has been reset.

Where required, facilities to connect protective devices and interlocks shall be provided. If such a protective device or interlock causes a stop of the machine, it may be necessary for that condition to be signalled to the logic of the control system. The reset of the stop function shall not initiate any hazardous situation.

Where more than one control station is provided, stop commands from any control station shall be effective when required by the risk assessment of the machine. In addition to the requirements for the emergency stop function has the following requirements:

- It shall override all other functions and operations in all modes
- Power to the machine actuators that can cause a hazardous situation(s) shall be either removed immediately (stop category 0) or shall be controlled in such a way to stop the hazardous motion as quickly as possible (stop category 1) without creating other hazards
- Reset shall not initiate a restart

The choice between these two stopping methods is determined by an evaluation of the machine-related risks.

This function includes several sub-functions either Safe Torque off (stop category 0), Safe Stop 1 (stop category 1) or Safe Stop 2 (stop category 2) and is represented by the drawings opposite.

The operator interface may be:

- Pushbutton equipped with a mushroom head
- Cable actuated switch
- Foot switch

### Typical architecture

**Safety chain solution:**

- > Emergency Stop with Embedded Safety Module / Emergency Stop Pushbutton / Contactor / Cat.3 PL d, SIL2, Stop Category 0
- > Emergency Stop with Embedded Safety Module / Emergency Stop Pushbutton / Contactor / Cat.4 PL e, SIL3, Stop Category 0
- > Emergency Stop with Modular Safety Controller / Emergency Stop Pushbutton / Contactor / Cat.4 PL e, SIL3, Stop Category 0
- > Emergency Stop with Embedded Safety PLC / Emergency Stop Pushbutton / PacDrive 3 drive STO / Cat.4 PL e, SIL3 / Stop Category 0

STO: Safe Torque Off

SS2: Safe Stop 2, SOS: Safe Operating Stop

### Guard monitoring

### Explanation of function

#### Guards without guard locking device

On a large number of potentially dangerous machines, the operator must be kept at a distance during operation, but needs to take action when the machine is stopped to position a part, remove a product or adjust a tool.

An effective means of protection is to install a guard which, according to the type of installation, will cut-off the power to the motor if an attempt is made to open it during the machine operating phase.

In all cases, it must not be possible to restart the machine until the guard is closed. Depending on the level of protection required, the system will comprise two conventional limit switches or a combination of protected, actuator operated guard switches to prevent tampering.

#### Guards with guard locking device

This type of guard is necessary for potentially dangerous machines with high inertia (long rundown time).

The guard is interlocked (by a solenoid for example); it cannot be opened until the machine has come to a complete standstill.

Guard without guard locking device

### Guard Monitoring

### Explanation of function

2

#### Coded magnetic guard switch and system

A non-contact solution is often used on industrial machines fitted with a door or guards with imprecise guiding.

It is particularly suitable for machines subjected to frequent washing or splashing of liquids as well as small machines with a single guard for self-contained systems. Depending on the models used, the sensing distance will be between 5 and 10 mm. The reed contacts used for the coded magnetic switches cannot withstand short circuits and the switches always incorporate a resistor in series. Their operation can therefore only be guaranteed with the associated processing module. The Hall-effect self-contained systems with integral processing module do not require any further processing of the signal.

The illustrations opposite show the functions of coded magnetic guard switches and of a system.

Coded magnetic guard switch

### Typical architecture

#### Safety chain solution:

### Perimeter guarding

Safety light curtain

Safety mat

Example of a safety mat application

### Explanation of function

#### Safety light curtains

Safety light curtains are electro-sensitive systems (Electro-Sensitive Protective Equipment) designed to protect persons working in the vicinity of machinery, by stopping dangerous movements when a light beam is broken.

The absence of a door or guard reduces loading, inspection or tool changing times. This type of system, defined by standards EN/IEC 61496-1 and EN/IEC 61496-2, is frequently used with machines such as:

- presses
- machine tools
- assembly lines, etc.

The machine must be designed so that it is impossible to gain access to dangerous movements without breaking one or more of the light beams. In addition, the movement must be stopped whatever the entry speed of the operator into the hazardous zone.

The diagram opposite illustrates the operation of a light curtain.

### Typical architecture

#### Safety chain solution:

- > Perimeter Guarding with Safety Module / Single beam Light Curtains / Contactor / Cat.3 PL c, SIL 1 / Stop Category 0
- > Perimeter Guarding with Embedded Safety Module / Light Curtain / Contactor / Cat.4 PL e, SIL 3 / Stop Category 0
- > Perimeter Guarding with Embedded Safety Module / Light Curtain / Variable Speed Drive / Cat .3 PL d, SIL 2 / Stop Category 1
- > Perimeter Guarding with Modular Safety Controller / Light Curtain / Contactor / Cat.4 PL e, SIL 3 / Stop Category 0

### Explanation of function

#### Safety mats

Safety mats are used to detect persons walking across or standing on the mat or objects falling onto the mat. Standards EN 1760-1/ISO 13856 define their performance.

Any detection of an object on the mat initiates stopping of any dangerous machine movement.

Restarting can be controlled manually or automatically, depending on the configuration of the associated processing unit.

When pressure is applied, the mat distorts locally and the integrated sensors are short-circuited.

The special design of these sensors requires that the mat and the detection module be matched.

In general, several mats are used to cover the safety zone.

The safety distance **S**, defined by the standard, takes into account the speed at which a person can cross the safety zone to reach the hazardous zone.

### Typical architecture

#### Safety chain solution:

- > Perimeter Guarding with Safety Module / Safety Mat / Contactor / Cat.3 PL d, SIL2 / Stop Category 0

### Enabling movement

### Explanation of function

2

#### Two-hand control stations

Standards ISO 13851 and EN 574 define this device. It requires simultaneous operation by both hands in order to start and maintain operation of a machine. It therefore provides protection exclusively for the person operating it.

A diagram representing the function is given opposite; it must meet the following requirements:

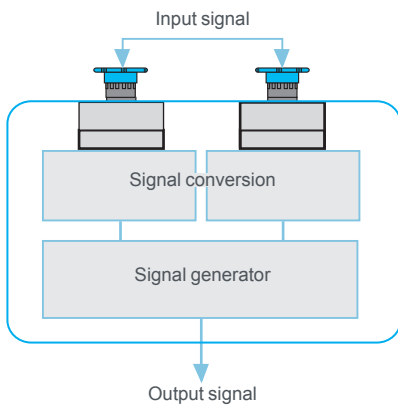

- > Concurrent, maintained operation of the two input controls for the same period of time
- > Synchronous operation; the delay between the two signals must not exceed 0.5 s
- > Prevention of accidental operation (mechanical guard)
- > Protection against tampering

Enabling switches, allow authorized personnel to carry out maintenance, adjustment or programming operations within hazardous zones of machines, provided certain conditions are met. These devices conform to standards EN/IEC 60947-5-8 and EN/IEC 60204-1. In effect, to gain access, these operations, often performed at reduced speed, must be selected by authorized personnel using selectors with key or equivalent.

Important note: the enabling switch alone must not lead to the actuation of any dangerous movements associated with the machine; a secondary, intentional, control action is required from the operator. All devices which conform to the standard must be identified by the marking scheme shown opposite.

Two-hand control stations

Functions of a two-hand control station

#### Enabling Switch

##### Operating principle

The three possible states are:

- > Position 0: contact open (control operator at rest)
- > Position 1: contact closed (control operator depressed to normal enabling position)
- > Position 2: contact open (control operator fully depressed)

When the switch is depressed in position 1, it must return to position 0 when released. The switch must change from position 1 to position 2 when pressed more firmly. When it is released from position 2 to position 0, the switching contact must not close.

Enabling Switch

Marking identifying an enabling switch

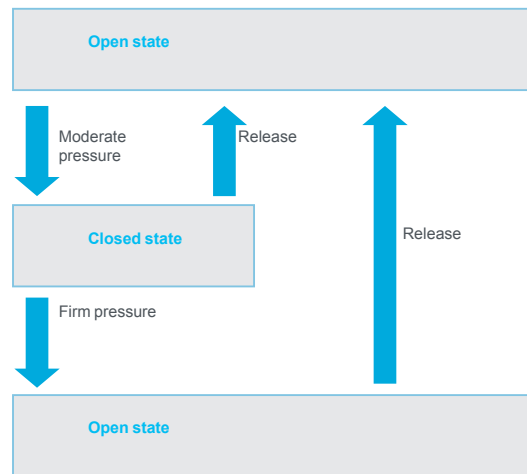

Position 0

Position 1

- > Enable Machine Movement with Safety Controller / Two Hand Control Station / Contactor / Cat.4 PL e, SIL 3
- > Enable Machine Movement with Modular Safety Controller / Two Hand Control Station / Contactor / Cat.4 PL e, SIL 3

### Speed monitoring

Speed monitoring

Sensor control

### Explanation of function

#### Zero speed monitoring

##### Detection principle

The two sensors to be arranged that only one sensor is activated at any given time. If the inputs are in the low state, the zero speed signal will disappear after  $t=1/f$  seconds and an open-circuit will be indicated. If the 2 inputs are in the high state, the zero speed signal will disappear after  $t=1/f$  seconds and a short-circuit will be indicated. If the 2 inputs are in the high or low state after starting, no enabling will take place.

### Sensor States and Behavior

Switch-on Sequence			
State of Sensor 1	0	0 (1)	1
State of Sensor 2	0	1 (1)	1
Behavior	Error Message	Zero Speed	Notification (2)
Output	0	1	0
Operation			
State of Sensor 1	0	0 (1)	1
State of Sensor 2	0	1 (1)	1
Behavior	Error Message	Zero Speed	Notification
Output	0	1	1

(1) If the state of the sensors is inverse (0/1, 1/0), the behavior is identical.  
 (2) If the firmware version is earlier than 2.34 an error message (short circuit between inputs) appears instead of a notification. This error message must be acknowledged with the reset button.

#### Detection principle 2

Preventa safety modules XPSVNE for zero speed detection are used to detect the stop condition of electric motors. Their most common applications include: providing the unlock signal for electrically interlocked sliding or removable machine guards, controlling rotation direction signals for reversing motors and engaging locking brakes after a motor has come to a standstill.

As electric motors run down, a remanent voltage is produced in the windings of the motor due to residual magnetism. This voltage is proportional to the speed of the motor and, therefore, decreases as the motor comes to a standstill.

This remanent voltage is measured in a redundant manner so as to detect the stop condition of the motor. The cabling between the motor windings and the inputs of the XPSVNE module is also monitored to prevent a cabling breakage or fault being seen as a stopped motor.

A transformer should not be used to connect the motor to terminals Z1, Z2 and Z3 since there is no monitoring of the connection with the motor winding via the resistance monitoring.

Modules XPSVNE are suitable for detecting the stop condition of all types of AC or DC motor driven machines which, when the motor runs down, produce a remanent voltage in the windings due to residual magnetism. These machines can be controlled by electronic devices, such as variable speed drives or DC injection brakes. The input lters for standard XPSVNE modules are designed for a frequency of up to 60 Hz.

For motors operating at a frequency higher than 60 Hz, which therefore produce a high frequency remanent voltage, special modules XPSVNE●●●●HS should be used. Modules XPSVNE have t2 potentiometers mounted on the front face of the module which allow independent adjustment of the switching threshold for each input circuit. This allows adjustment for different types of motors and application requirements. To aid diagnostics, modules XPSVNE have 4 LEDs and 2 solid-state outputs to provide information on the status of the zero speed detection circuit.

### Speed monitoring

### Explanation of function

#### Motion safety functions

##### Safety-limited speed

The SLS function prevents the motor from exceeding the specified speed limit.

When this function is initiated the machine starts to decelerate to the specified safe speed  $v_2$  with in the specified time  $t_2$ . Once the machine reaches the safe speed  $v_2$  then the function will monitor the speed stays below safe speed  $v_2$ .

In case of speed exceeding specified speed during time  $t_2$  and further, safety function will initiate either SS1 or STO to stop the machine in minimum time.

##### Safe maximum speed

The SMS function provides a safe output signal to indicate whether the motor speed is below a specified limit.

This safety function is an optional function to set an upper limit parameter for continuous monitoring. If the speed of the machine exceeds the specified value then specified safe output will change its state.

##### Safe direction

The SDI function prevents the motor shaft from moving in the unintended direction.

### Typical architecture

#### Safety chain solution:

- > Speed Monitoring with Safety Module / Remanent Voltage detection and limit switch and Guard switch with lock / Contactor / Cat.4 PL e, SIL 3 / Stop Category 0
- > Speed Monitoring with Modular Safety Controller / Safety Encoder / Contactor / Cat.4 PL e, SIL 3 / Stop Category 0
- > Speed Monitoring with Embedded Safety PLC / Selector Switch / PacDrive 3 Drive SLS / Cat.4 PL e, SIL 3 / Safe Limited Speed

2

Safety-limited speed

Safe maximum speed

Safe direction

### Position monitoring

Landing indicator (stop reference point)  
Vertical position monitoring

Safe operating stop (SOS)

### Explanation of function

#### Vertical position monitoring

When the cabin is parked at a landing, with the doors open, some lifts automatically correct their level (isolevelling) in relation to the landing in order to compensate for any differences generated by modification of the load in the cabin.

During this operation, European standard EN-81 recommends that the presence of the cabin be checked within a zone of +/- 0.2 m around the landing (door unlocking zone), by means of a safety circuit which will cause the cabin to stop if it moves out of the specified zone.

The use of the safety module XPS EDA, which checks the presence of the cabin in the specified zone at two points, meets this requirement.

The module incorporates two safety outputs and two solid-state outputs for signaling functions. Four LEDs on the front face of the module provide visual indication of the status of the safety circuit.

The position of the cabin in relation to the landing is detected by two limit switches in the lift shaft. It is also possible to use non-contact sensors (magnetic sensors with reed contact).

When the cabin reaches the preset position and when it is within the permissible tolerances in relation to the landing, the two safety circuits in safety module XPS EDA close and allow isolevelling of the cabin with the doors open. Any change in one of the input signals (cabin outside the specified zone) or detection of a fault (break in the wiring, short-circuit, etc.) causes immediate opening of the safety outputs in the XPS EDA module and subsequent stopping of the cabin.

#### Motion safety function:

##### Safe operating stop (SOS)

The SOS function prevents the motor from deviating more than a defined amount from the stopped position. The drive provides energy to the motor to enable it to resist external forces. The Safe Operating Stop function is most commonly used in conjunction with the Safe Stop 2 function where the machine movement enters into zero speed the Safe Operating Stop is enabled.

### Typical architecture

#### Safety chain solution:

- > Position Monitoring with Embedded Safety PLC / Coded Magnetic Switch / PacDrive 3 Drive SS2 / Cat.4 PL e, SIL 3 / Stop Category 2

Control units Ø 16 plastic

Harmony XB6E monolithic and XB6 modular

Emergency stop pushbuttons

## Presentation

The Ø 16 mm/0.630 in. Harmony XB6 and XB6E plastic range of Emergency stop pushbuttons is compact and thus suitable for installation on small machines and control panels. Their reduced diameter makes them suitable for applications where mounting space is less. Designed for control of machines and installations, these functions meet the requirements of majority of industrial applications.

- This range includes:
  - Ø 32 mm/1.260 in. Emergency stop trigger action pushbuttons for Start/Stop control of machines and installations, adjustment and parametering (contact functions),
  - Ø 32 mm/1.260 in. Illuminated Emergency stop pushbuttons for control and signaling (contact functions and signaling functions),
  - Fast connector sockets with push-in technology,
  - Various accessories.

## Installation

- Harmony XB6 and XB6E products are both simple and quick to install:
  - Mounting by single installer (self-maintaining of the head in its cut-out)
  - Clip-together component system (head, body, contact blocks and LED)
- Type of connection:
  - For XB6 and XB6E: faston connector
  - For XB6E: fast connector socket

## Environment

The performance features of these range meet the most demanding international standards and approvals:

- Degrees of protection:
  - For XB6 and XB6E: IP 65 conforming to standard IEC 60529
  - For XB6: NEMA type 4, 4X and 13 conforming to standard UL 50 and CSA C22-2 n° 94 (except key switches)
- International standards:
  - For XB6 and XB6E: EN/IEC 60947-5-5
  - For XB6: conform to standards EN/IEC 60204-1 and EN/ISO 13850, to Machinery Directive 98/37/EC and to standard EN/IEC 60947-5-5
- Product certifications:
  - For XB6E: UR, CCC,
  - For XB6: UL, CSA, CCC, GOST

## Control units Ø 22

### Emergency stop and Emergency switching off functions

#### Presentation

The Ø 22 mm/0.866 in. Harmony XB4 metal, XB5 plastic, and XB7 plastic range of Emergency stop and Emergency switching off functions combines simplicity of installation, flexibility, robustness, ergonomics and reliability. Designed for control of machines and installations, these functions meet the requirements of majority of industrial applications.

Following are broad and comprehensive offer under this range:

- Emergency stop trigger action and mechanically latching pushbuttons (conforming to standards EN/IEC 60204-1 and EN/ISO 13850)
- Emergency switching off mechanically latching pushbuttons (conforming to standard IEC 60364-5-53)
- Legends and legend holders
- Accessories and spare parts

#### Installation

- These products are both simple and quick to install:
  - Mounting by single installer (self-maintaining of the head in its cut-out)
  - Clip-together component system (head, body, contact blocks and LED)
  - Fixing by a single locking screw
  - Anti-loosening system for screw clamp terminals of contact blocks.
- Various types of connection are available:
  - Screw clamp terminal connector
  - Spring clamp terminal connector
  - Faston connector
  - Plug-in connector

#### Environment

The performance features of these range meet the most demanding international standards and approvals:

- Degrees of protection:
 

The range includes products for use in difficult industrial environments, due to:

  - Their high degree of protection for harsh environments (IP 66 / IP 69K with bellows)
  - Their resistance to high pressure cleaning
  - Their "all climates" TH compatibility
  - A wide choice of contact blocks with various breaking capacities (low, standard or high power switching)
  - For XB7: IP 65 for Emergency stop pushbuttons
- International standards:
  - Emergency stop function: Mushroom head Emergency stop trigger action and mechanical latching pushbuttons conform to standards EN/IEC 60204-1 and EN/ISO 13850, to Machinery Directive 2006/42/EC and to standard EN/IEC 60947-5-5.
  - Emergency switching off function: Mushroom head switching off mechanical latching pushbuttons conform to standards IEC 60364-5-53 and EN/IEC 60947-5-5.

For XB7,

  - Emergency stop function: EN/IEC 60947-5-5, EN/ISO 13850 and EN/IEC 60204-1
  - Emergency switching off function: EN/IEC 60364-5-53
- Product certifications:
  - UL 508, CSA C22-2 n° 14, and GB 14048.5
  - International certifications: UL, CSA, CCC, EAC
  - Marine certifications for XB4 and XB5: BV, RINA, LROS, DNV, GL

Please consult our Customer Care Centre for a full explanation of these standards and directives.

**protected**  
**LED**

(1) Recommended maximum number of contacts constituting the body (fixing collar + contact) associated with the head, see page 12 of Harmony XB4 catalog DIA5ED21212EN.

(2) It is recommended that a legend or yellow background is used.

(3) The symbol  indicates key withdrawal position(s).

(4) Other key numbers:

- key n° 421E: add suffix **12** to the reference.
- key n° 458A: add suffix **10** to the reference.
- key n° 520E: add suffix **14** to the reference.
- key n° 3131A: add suffix **20** to the reference.
- key n° 4A185: add suffix **D** to the reference.

Example: To order a Ø 40 mm/1.575 in. red mushroom head for a trigger action and mechanical latching Emergency stop pushbutton, with release by key n° 421E, the reference becomes: **ZB4BS94412**.

(5) For specific keys with other numbers, please consult our Customer Care Centre.

(6) Only for use with bodies comprising a light source with integral LED.

## Illuminated Emergency switching off function only, mechanical latching pushbuttons (1)

Screw clamp terminal connections (Schneider Electric anti-loosening system)

Shape of head	Type of reset	Push	Color	Reference	Weight kg/lb
		Ø (mm)/in.			
	Turn to release	40/1.575	Red	<b>ZB5AW743</b>	0.022/0.049

(1) Recommended maximum number of contacts constituting the body (fixing collar and contact) associated with the head, see page 12 of Harmony XB5 catalog DIA5ED2121213EN.

(2) It is recommended that a legend or yellow background is used.

(3) The symbol indicates key withdrawal position(s).

(4) Other key numbers:

- key n° 421E: add suffix **12** to the reference.
- key n° 458A: add suffix **10** to the reference.
- key n° 520E: add suffix **14** to the reference.
- key n° 3131A: add suffix **20** to the reference.
- key n° 4A185: add suffix **D** to the reference.

Example: To order a Ø 40 mm/1.575 in. red mushroom head for a trigger action and mechanical latching Emergency stop pushbutton, with release by key n° 421E, the reference becomes: **ZB5AS94412**.

(5) For specific keys with other numbers, please consult our Customer Care Centre.

(6) Only for use with bodies comprising a light source with integral LED.

(7) Cannot be used with metal guards **ZBZ160**.

## Clip-on legend holder, sheet of blank legends and labelling software

Description	Sold in lots of	Unit reference	Weight kg/lb
Clip-on legend-holder for electrical blocks with screw clamp terminal connections (5). For identification of an XB4B control or signaling unit	10	ZBZ001	0.001/0.002
Sheet of 50 blank legends for legend holder ZBZ001	10	ZBY001	0.023/0.051
"SIS Label" labelling software for legend design (ZBY001 legends) (for design of legends in English, French, German, Italian, Spanish)	1	XBY2U	0.100/0.220

(1) The contact blocks enable variable composition of body/contact assemblies. Maximum number of rows possible: 3. Either 3 rows of 3 single contacts or 1 row of 3 double contacts + 1 row of 3 single contacts (double contacts occupy the first 2 rows). Maximum number of contacts is specified on page 12 of Harmony XB5 catalog DIA5ED2121213EN.  
 (2) It is not possible to fit an additional contact block on the back of these contact blocks.  
 (3) It is not possible to fit an additional contact block on the back of these contact blocks or to use these contacts with light blocks.  
 (4) To be fitted on the back of ZBE50● contacts.  
 (5) This legend holder is not compatible with high power switching contacts.

(1) Standard circular legends are not compatible with this product. Use special legends ZBY9●●●T.

(2) No isolation function is possible when this guard is fitted.

(3) Ensures conformity with standards EN/IEC 60204-1 and EN/ISO 13850.

(4) Ensures conformity with standard EN/IEC 60204-1.

(5) Only when mounted on control stations. Use legends ZBY9●●●T.

## Control units Ø 30 Harmony 9001K & SK range Emergency stop pushbuttons

### Presentation

The Ø 30 mm/1.181 in. Harmony 9001 range of Emergency stop and Emergency switching off functions is robust and meet a great number of applications in heavy industries such as: petrochemical, metallurgy, mining, oil and gas, wastewater treatment, and automobile manufacturing.

- Two family of products are available :
  - The Harmony 9001K control and signalling units offering good robustness with a chromium plated metal bezel
  - The Harmony 9001SK control and signalling units, with a double insulated bezel designed for applications requiring a high resistance to corrosion
- This range includes:
  - Emergency stop trigger action and mechanical latching pushbuttons (conforming to standards EN/IEC 60204-1 and EN/ISO 13850)
  - Choice of accessories and spare parts common to both families,
  - Choice of aluminium or plastic legend plates.

### Installation

- Harmony 9001 products are both simple and quick to install:
  - Block setting by single installer with a single screw contact block,
  - Automatic self-grounding operators without additional wiring,
  - Easy function identification thanks to the coloured contact blocks,
  - Clear window for status of contact operation and troubleshooting,
  - Side-by-side and/or stacked mounting of contact blocks to minimize enclosure space requirements.
- Connection is made through screw clamp terminals (cross headed slotted screw)

### Environment

The performance features of these range meet the most demanding international standards and approvals:

- Degrees of protection:

Products are originally oil-tight, dust-tight and water-tight. No boot needs to be added.

  - For 9001K chromium plated metal bezel: IP 66 according to IEC 61140 and NEMA type 1, 2, 3, 3R, 4, 12 and 13
  - For 9001SK plastic bezel: IP 66 according to IEC 61140 and NEMA type 1, 2, 3, 3R, 4, 4X, 12 et 13.
- International standards:
  - EN/IEC 60204-1 et EN/ISO 13850 for Emergency stop mushroom head pushbuttons (if used with the Emergency stop legend plates)
- Product certifications:
  - International certifications: UL, CSA, NOM, RoHS, GOST

Operator dialogue terminals  
 Magelis™ XBTGH Advanced hand-held panel  
 Emergency stop function

Magelis XBTGH with emergency stop

3

## Presentation

The Magelis XBTGH Advanced hand-held panel offers a portable touch screen terminal with 5.7" color screen and a safety device: Emergency stop.

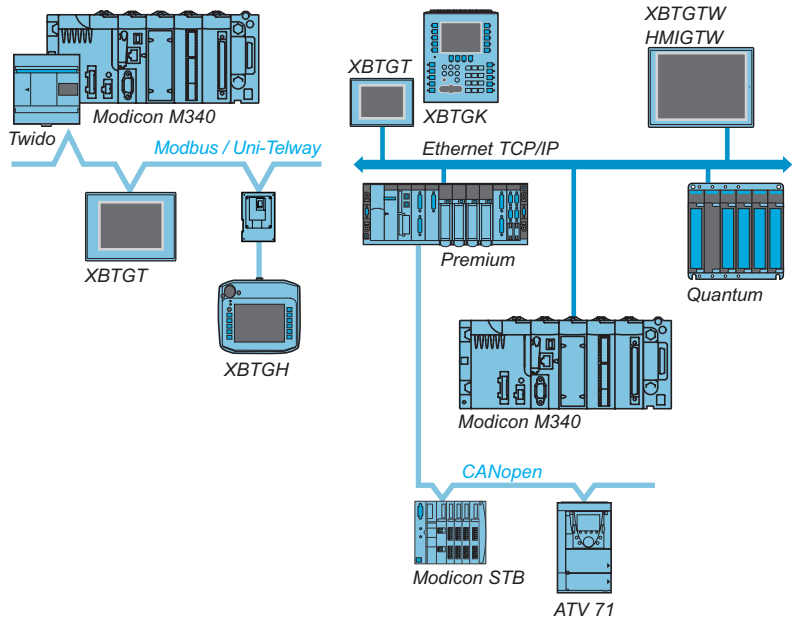

The emergency stop button with 2 NC safety contacts and 1 NO auxiliary contact is used to stop the machine during emergency.

## Operation

These terminals are available in multifunction levels (5.7" ) which features new information and communication technologies:

- High level of communication (embedded Ethernet, multi-link, Web server and FTP)
- External storage of data (Compact Flash memory card and USB memory stick) for storing production data and backing up applications
- Multimedia data with integrated image and sound management (digital or analog camera)
- Management of peripherals: Printers, bar code readers, loudspeakers, etc.

## Communication

Magelis Standard Advanced panel communicate with PLCs via one or two integrated serial links, using communication protocols:

- Schneider Electric (Uni-TE, Modbus)
- Third-party: Mitsubishi Electric, Omron, Allen-Bradley and Siemens

(1) For more information on Magelis XBTGH functions, description and connection accessories, please refer to Magelis XBTGH Advanced hand-held panel catalog in our website [www.schneider-electric.com](http://www.schneider-electric.com).

(2) The XBTGH terminal is connected to junction box XBTZGJBOX using cable XBTZGHL●●, to be ordered separately.

(3) A junction box is required at each XBTGH terminal connection point.

(4) With this cable, the following limitations apply to the junction box:

- no RS 232C serial link
- an isolation box cannot be used
- 24 V  $\overline{\text{DC}}$  supply voltage tolerance of approximately 10%

(1) Can only be used for actuation of end of row (side) mounted contacts.

(2) The symbol "Q" indicates key withdrawal position(s).

(3) Other key numbers:

- key n° 421E: add suffix **12** to the reference,
- key n° 458A: add suffix **10** to the reference,
- key n° 520E: add suffix **14** to the reference,
- key n° 3131A: add suffix **20** to the reference.

Example:

For a key switch head with key n° 421E, 2-position stay put with key withdrawal from the left-hand position, the reference becomes: **ZB5AG212**.

(4) For specific keys with other numbers, please consult our Customer Care Centre.

## Wireless remote control system

### Harmony eXLhoist

Example of overhead travelling cranes

#### Presentation

The Harmony eXLhoist range of wireless remote control systems provide complete and innovative crane operator control solutions to: improve the machine and crane operator efficiency, enhance safety for people and equipment, and to reduce installation and maintenance downtime.

The remote control system XARS is a combination of remote control device (or transmitter: XART) and base station (or receiver: XARB), which transmits commands and information from the operator to the machine and vice versa by a wireless transmission means.

The XARS system offers movement in 3 directions (for example: hoist, bridge, and trolley) at 2 speed levels (low and high) for each movement.

The 2 modes available in the system are:

- Single mode: the remote control device controls one base station
- Tandem mode (1): the remote control device controls 2 base stations simultaneously.

#### Radio communication

Each base station have a unique identification code (2) managed by Schneider Electric. The frequency of radio communication is 2.4 GHz and the automatic frequency hopping permits up to 50 systems working at same time in an 100 x 100 m/328 x 328 ft area.

#### eXLhoist Configuration software

A free of charge software with graphic user interface can be downloaded by the customer to configure the remote control station. This software has a standard Windows® interface. The configuration file is password protected and allows to configure the following parameters:

- Base station pairing to remote control device
- Relays-pushbuttons assignment and interlock
- Access and re-start sequence
- Time-out duration to standby
- Machine number assignment

Configuration software window

#### Environment

The degree of protection for Harmony eXLhoist are:

- IP 65 for base station
- IP 65 and NEMA 4 for wireless control device
- Product certifications for base station: UL/CSA, CE, EAC
- Product certifications for wireless control device: UL/CSA, CE, EAC.

(1) Tandem mode will be available in 2<sup>nd</sup> quarter 2015

(2) Third-party device cannot communicate with remote control system.

### Description

#### Remote control device

The base station has following controls:

- 1-6 Auxiliary buttons (For ZART8D and ZART8L only 5 and 6 buttons are available)
- 7 Display (for ZART8L only LED display)
- 8 E-stop LED
- 9 OFF/ Stop button
- 10 ON/ Start/ Horn button
- 11 Motion buttons
- 12 Cover
- 13 RJ45 connector
- 14 Reset button
- 15 Trigger button
- 16 Connector for charging remote device
- 17 Cover of the connector
- 18 E-stop button

#### Base station

The base station has following controls:

- 1 M12 for external antenna (1)
- 2 Status LEDs
- 3 M20 for the Safeguarding function input wires (1)
- 4 62 pins connector (1)
- 5 M25 for output wires (2)
- 6 M25 for detected applicative alarms input wires (1)
- 7 4 holes for standard mounting on support (1)

(1) Covered by cap

(2) Covered by cable gland

(1) Use of this accessory allows to increase radio range in severe environment conditions.

### Operating principle

Enabling switches, comprising an XY2 AU grip and an XPS VC monitoring module, allow authorised personnel to undertake adjustment, programming or maintenance operations near machine equipment hazardous zones, providing certain conditions are met.

In effect, to gain access, these operations, often performed at reduced speed, must be selected by authorised personnel using selectors, with or without keys. Once selection is made, the enabling switch temporarily assumes control of the hazardous zone's usual protection measures. Important note: the enabling switch alone must not lead to the actuation of any dangerous movements associated with the machine; a secondary, intentional control action is required from the operator. In addition, each person in the hazardous zone must be provided with an enabling switch to ensure their own safety.

### Environment

Conforming to standards	Products		IEC/EN 60947-1 , IEC/EN 60947-5-1, cUL us 508 and CSA C22-2 n° 14
	Machine assemblies		IEC/EN 60204-1
Maximum safety level (1)			PL e, category 4 conforming to EN/ISO 13849-1 and SIL 3 conforming to EN/IEC 61508
Reliability data B10d			5,000,000 (data value for a service life of 10 years: can be limited by contact and mechanical wear)
Protective treatment			Standard version: TC
Ambient air temperature	Operation	°C	- 10...+ 60
	Storage	°C	- 40...+70
Vibration resistance			6 gn (5...55 Hz) conforming to IEC 60068-2-6
Shock resistance			10 gn (11 ms) conforming to IEC 60068-2-27
Electric shock protection			Class II conforming to IEC/EN 61140
Degree of protection			IP 66 conforming to IEC 60529, IP 65 with a pushbutton, IK 06 conforming to EN 50102
Mechanical durability		Op. cycle	1 million
Enclosure			Double insulated enclosure made of PA66
Cable diameter		mm	7...13

### Contact block characteristics

Rated operational characteristics			~ AC-15 : C300 or Ue = 250 V, Ie = 1.5 A or Ue = 125 V, Ie = 0.75 A --- DC-13 : R300 or Ue = 250 V, Ie = 0.1 A or Ue = 125 V, Ie = 0.22 A conforming to IEC 60947-5-1 Appendix A
Thermal current (Ithe)	A		5
Rated insulation voltage (Ui)	V		250, degree of pollution III (II inside) conforming to IEC 60947-1 125, contact 7-8
Rated impulse withstand voltage (Uimp)	kV		2.5 conforming to EN 60947-1
Positive operation			2 3-position contacts with positive opening operation conforming to IEC 60947-5-1 appendix K
Contact operation			Slow break
Resistance across terminals	mΩ		≤ 50
Actuation force			1...2: 12 N 2...3: 50 N
Terminal referencing			Numbered conforming to CENELEC EN 50013
Short-circuit protection			4 A cartridge fuse type gG (gl)
Connection	mm²		Terminal block, 1 x 0.34...1 x 1.5

(1) Using an appropriate and correctly connected control system.

## Two-hand ergonomic control stations

### With Harmony XB4 B control units

#### Presentation

The design of the control station incorporates features to significantly reduce occupational illnesses associated with repetitive movements of the hands, particularly "carpal tunnel syndrome".

The health and comfort of the machine operator is assured by:

- the numerous alternative hand positions for operating the 2 pushbutton actuators, see diagrams to left,

- a hand rail,
- simple and fast adjustments of control station position.

This two-hand control station protects machine operators against both industrial accidents and illnesses related to their occupation.

It conforms to the following European safety standards:

- EN 574/ISO 13851 (two-hand control),
- EN 999 (approach speeds of parts of the human body and positioning of safety devices).

The control station can be mounted:

- directly on the machine housing,
- on a pedestal, enabling 3 directional adjustment:
  - height,
  - rake,
  - skew.

The use of a two-hand control station in conjunction with a safety module type XPS BCE or XPS BF provides type IIIC two-hand control conforming to EN 574/ISO 13851 and PL e / Category 4 according to EN/ISO 13859-1.

The range comprises:

- two-hand control stations with or without pre-wired terminal blocks,
- kits (control station + pedestal), with or without pre-wired terminal blocks.

The products are supplied with an installation manual, which is also available as a separate item.

### Description

The control station **1** has five cut-outs ( $\varnothing 22$  mm) **2** as standard. Five additional cut-outs are possible **3**. Its pedestal **5** enables the following quick and simple adjustments:

- Control station rake ( $\pm 30^\circ$ ) using handle **4**.
- Control station skew ( $\pm 180^\circ$ ) using handle **6**.
- Control station height (835 to 1170 mm) using handle **6**.

The baseplate **8** can be fitted with safety foot switches XPE R **9**, together with their protective covers **7**.

### Characteristics

<b>Environment</b>				EN/IEC 60947-5-1, EN 574/ISO 13851
<b>Conformity to standards</b>				PL e, category 4 conforming to EN/ISO 13849-1 and SIL 3 conforming to EN/IEC 61508
<b>Maximum safety level (1)</b>				25,000,000 (data value for a service life of 10 years: can be limited by contact and mechanical wear)

Applications

**Modules**

For the monitoring of applications requiring safety time delays

For coded magnetic switch monitoring

For 2 max.

For 6 max.

For zero speed detection of AC or DC motors which produce a remanent voltage in their windings due to residual magnetism

For lift control

For dynamic monitoring of hydraulic valves on linear presses

For dynamic monitoring of double-bodied solenoid valves

For safety stop at top dead centre with automatic overtravel monitoring and control

## Preventa safety modules types XPSAC, XPSAXE

For Emergency stop and switch monitoring

### Operating principle

Safety modules **XPSAC** and **XPSAXE** are used for monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1 and also meet the safety requirements for the electrical monitoring of switches in protective devices conforming to standard EN/ISO 14119. They provide protection for both the machine operator and the machine by immediately stopping the dangerous movement on receipt of a stop instruction from the operator, or on detection of a fault in the safety circuit itself.

To aid diagnostics, the modules have LEDs which provide information on the monitoring circuit status.

- The **XPSAC** module has 3 safety outputs and a solid-state output for signalling to the PLC.

- The **XPSAXE** module has 3 safety outputs and a relay output for signalling to the PLC

## Preventa safety modules types XPSAV, XPSABV, XPSATE

For Emergency stop and switch monitoring

### Operating principle

Safety modules **XPSAV**, **XPSABV** and **XPSATE** are used for monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1 and also meet the safety requirements for the electrical monitoring

of switches in protection devices conforming to standard EN/ISO 14119.

They provide protective for both the machine operator and the machine by immediately stopping the dangerous movement on receipt of a stop instruction from the operator, or on detection of a fault in the safety circuit itself. In addition to the stop category 0 instantaneous opening safety outputs (3 for **XPSAV**, 2 for **XPSABV** and 2 for **XPSATE**), the modules incorporate stop category 1 time delay outputs (3 for **XPSAV**, 1 for **XPSABV** and 3 for **XPSATE**) which allow for controlled deceleration of the motor components until a complete stop is achieved (for example, motor braking by variable speed drive).

At the end of the preset delay, the supply is disconnected by opening the time delay output circuits.

- For module **XPSAV**, the time delay of the 3 output circuits is adjustable, in 15 preset values, between 0 and 300 seconds using selector buttons.
- For module **XPSABV**, the time delay of the 3 output circuits is adjustable between 0.15 and 3 seconds or 1.5 and 30 seconds, depending on the model, using a selector switch.
- For module **XPSATE**, the time delay of the 3 output circuits is adjustable between 0 and 30 seconds using a 12-position selector switch.

Module **XPSAV** also incorporates 3 solid-state signalling outputs for signalling to the process PLC.

Module **XPSATE** incorporates 4 solid-state signalling outputs for signalling to the process PLC.

To aid diagnostics, the modules have LEDs which provide information on the monitoring circuit status.

The Start button monitoring function is configurable depending on the wiring.

### Operating principle

Safety modules **XPSATR** meet the requirements of Performance Level PL e/Category 4 conforming to standard EN ISO 13849-1.

Safety modules **XPSATR** are electronic, redundant and self-monitoring devices with positively driven relays.

They are used for monitoring Emergency stop circuits (single or two-channel) and protective guard applications.  
The modules are conforming to standards EN/ISO 13850 and EN 60204-1.

They provide protection for both the machine operator and the machine by immediately stopping the dangerous movement on receipt of a stop instruction from the operator, or on detection of a fault in the safety circuit itself.

**XPSATR** incorporate 3 NO and 1 NC not delayed contacts and 3 delayed NO contacts.

To aid diagnostics, the modules have 5 LEDs on the front face which provide information on the monitoring circuit status.

## Preventa safety modules type XPSAFL

For Emergency stop, switch and safety light curtain monitoring

### Operating principle

Safety modules **XPSAFL** meet the requirements of Performance Level PL e/Category 4 conforming to standard EN/ISO 13849-1.

They are used for:

- Monitoring Emergency stop circuits conforming to standards EN/ISO 13850 and EN/IEC 60204-1.
- Electrical monitoring of switches activated by protection devices conforming to standard EN/ISO 14119.

They can also be used for monitoring type 4 light curtains conforming to EN 61496-1 that have solid-state safety outputs (for example, light curtains type XUS L, see page 30304-EN/2). This system conforms to Performance Level PL e/Category 4 in accordance with EN/ISO 13849-1.

Housed in a compact enclosure, the modules have 3 safety outputs. Preventa safety modules **XPSAFL●●●●P** incorporate removable terminal blocks, thus optimising machine maintenance.

To aid diagnostics, the modules have 3 LEDs on the front face which provide information on the monitoring circuit status.

The Start button monitoring function is configurable depending on the wiring.

## Preventa safety modules type XPSAR

For Emergency stop, switch or safety light curtain monitoring

### Operating principle

Safety modules **XPSAR** meet the requirements of Performance Level PL e/ Category 4 conforming to standard EN/ISO 13849-1 and are designed for the following safety applications:

- Monitoring Emergency stop circuits conforming to EN/ISO 13850 and EN/IEC 60204-1.
- Electrical monitoring of switches activated by protection devices conforming to standard EN/ISO 14119.
- Monitoring type 4 light curtains conforming to EN/IEC 61496-1 that have solid-state safety outputs with test function (light curtains XUS L).

In addition to 7 safety outputs, modules **XPSAR** incorporate 2 relay signalling outputs and 4 solid-state signalling outputs for signalling to the process PLC.

Safety modules **XPSAR●●●●●●●P** incorporate removable terminal blocks, thus optimising machine maintenance.

To aid diagnostics, the modules have 4 LEDs on the front face which provide information on the monitoring circuit status.

The Start button monitoring function is configurable depending on the wiring.

### Operating principle

The enabling grip switch system, comprising an enabling switch XY2AU and a monitoring module **XPSVC**, enables authorised personnel to carry out adjustment, programming or maintenance operations within hazardous zones of machines providing certain conditions are met.

To be accessible, such operations are often carried out at reduced speed, and must be intentionally selected by authorised persons by means of a selector switch or key switch. Once the selection is made, the enabling switch system temporarily takes over from the hazardous zone's usual protection measures.

Caution: The enabling switch system alone must not cause dangerous movements of the machine to be activated; a second intentional control action on the part of the operator is required. In addition, each person remaining in the hazardous zone must be provided with an individual enabling switch to ensure their own safety.

XPSVC1132

### Operating principle

Two-hand control stations are designed to provide protection against hand injury. They require machine operators to keep their hands clear of the dangerous movement zone. The use of two-hand control is an individual protective measure, which can safely protect only one operator. Separate two-hand control stations must be provided for each operator in a multiple-worker environment.

Safety modules **XPSBAE**, **BCE** and **BF** for two-hand control stations comply with the requirements of European standard EN 574/ISO 13851 for two-hand control systems.

The control stations must be designed and installed such that they cannot be activated involuntarily or easily rendered inoperative. Depending on the application, the requirements of type C standards specific to the machinery involved must be met (additional personal protection methods may have to be considered).

To initiate a dangerous movement, both operators (two-hand control pushbuttons) must be activated within an interval  $\leq 0.5$  s (synchronous activation). If one of the two pushbuttons is released during a dangerous operation, the control sequence is cancelled. Resumption of the dangerous operation is possible only if both pushbuttons are returned to their initial position and reactivated within the required time interval.

The safety distance between the control units and the hazardous zone must be sufficient to ensure that when only one operator is released, the hazardous zone cannot be reached before the dangerous movement has been completed or stopped.

### Selection

#### Requirements of standard EN 574/ISO 13851

Standard EN 574/ISO 13851 defines the selection of two-hand controls according to its behavior. The following table details the 3 types of two-hand control conforming to EN 574/ISO 13851. For each type, it lists the operating characteristics and minimum requirements.

	Type I	Type II	Type III		
			A	B	C
Use of both hands (simultaneous action)					
Link between input and output signals					
Output signal inhibited					
Prevention of accidental operation					
Tamper-proof					
Output signal reinitialised					
Synchronous action (specified time limit)					
Use of proven components (Category 1 conforming to EN/ISO 13849-1)			XPSBAE		
Redundancy with partial error detection (Category 3 conforming to EN/ISO 13849-1)				XPSBCE XPSBF	
Redundancy + Self-monitoring (Category 4 conforming to EN/ISO 13849-1)					XPSBCE XPSBF
Two-hand control station	XY2SB●●				

Conforming to standard EN/ISO 13849-1

Meets the requirements of standard EN 574/ISO 13851

## Preventa safety modules and single-beam photo-electric sensors

With a test input associated with a built-in “muting” function

### Operating principle

XPSCM safety modules used in conjunction with XU2S single-beam photo-electric sensors (periodically tested), establish a category 2 light curtain conforming to IEC/EN 61496 parts 1 and 2.

The connection of 1 to 4 pairs of XU2S photo-electric sensors makes it possible to create a protected zone up to 1200 mm high conforming to EN 999/ISO 13855 and 8 m long.

The built-in “muting” function allows the automatic passage of parts to be machined, or loaded pallets, without interrupting the transportation movement.

When the system is switched on by the start command (in series with the main circuit feedback loop) and the light protection is not interrupted, the main circuit is closed by the two safety relays of the XPSCM module.

An interruption of the protective field causes the safety outputs to open instantaneously, and the process PLC receives a stop command. The LED on the XPSCM front panel changes from green to red. The “open” state is maintained until the module is restarted using the start button.

The “muting” function allows the light curtain protection to be inhibited. This can be used to authorise the passage of a materials trolley through the light curtain without tripping the main circuit. The “muting” function cannot be activated by supplying the inhibition sensors unless the safety outputs have been switched on beforehand.

To trigger the “muting” function, the inhibition devices must be activated within the 3 second time interval. This synchronisation time for the two inhibition inputs can be deactivated by connecting two configuration terminals. The “muting” cycle has a maximum duration of 60 seconds. During this period, materials can be transported through the protection field without deactivating the safety outputs. The 60 second limit value of the “muting” cycle may be made infinite by connecting two configuration terminals.

During the “muting” process, a light indicating the “muting” status is controlled by the XPSCM module. An fault at indicator light level (short-circuit, open circuit) will be immediately recognised and deactivate the “muting” function. The indicator light comes on when a “muting” signal is generated and indicates the inhibition of the protection function.

D1, D2, D3, D4: monitoring photo-electric sensors.  
MA1, MB1, MA2, MB2: “muting” photo-electric sensors.  
m = trolley length (including material)  
dM = distance between MA1, MB1 and MA2, MB2.

### Conditions to be observed for the “muting” function

- The “muting” sensors must either be:
  - Thru-beam type, sensing distance 8 m: XU2S18PP340L5 (or XU2S18PP340D).
  - Thru-beam type, sensing distance 15 m: XUB2BKSNL2T (or XUB2BKSNM12T) + XUB2BPANL2R (or XUB2BPANM12R).
  - Polarised reflex type, sensing distance 2 m: XUB9BPNAL2 (or XUB9BPNAM12) + XUZC50.
  - Polarised reflex type, sensing distance 5 m: XUM9APCNL2 (or XUM9APCNM8) or XUM9BPANL2 + XUZC50.
  - Limit switches.
- $dM \leq m$  to obtain continuous validation of the “muting” function.
- Avoid the intrusion of persons during the “muting” phase. This phase is indicated by the indicator light connected to the “muting” indicator output of the XPSCM module.
- A materials trolley must provide the “muting” signal before entering the protection field and cease it once it has cleared all the sensors of the protection field on exiting.

## Safety monitoring module

### Preventa XPSLCM

for the “muting” function of type 2 and type 4 safety light curtains

3

ESPE: electro-sensitive protection equipment (light curtain).  
A, B, D, C: “muting” sensors.  
m: trolley length and dM = distance between A, B and D, C.

### Operating principle

XPSLCM safety modules are used with type 4 light curtains conforming to EN/IEC 61496-1 to provide a system inhibiting the light curtain protection, i.e. “muting”. This function enables the automatic passage of parts for machining or loaded pallets, without interrupting the transportation movement within the zone protected by the electro-sensitive protection equipment (ESPE) system. In addition to the electro-sensitive protection and XPSLCM safety modules, the system comprises 4 to 8 inhibition sensors, 2 indicator lights and a key switch to reset the system to the initial state in the event of a sequence error.

When the system is switched on by the start command and the light curtain protection not interrupted, the main circuit is closed by the safety outputs of the XPSLCM modules (solid-state safety outputs). In addition to safety outputs, the modules incorporate signalling outputs for sending system status information to the PLC. Either 5 or 14 LEDs and a 2-digit display, mounted on the front face of the module, provide information on the safety circuit status.

An interruption of the protection field monitored by the electro-sensitive protection equipment causes instantaneous opening of the safety outputs; the process PLC receives a stop command and the LED display mounted on the front face indicates the change of state of the safety circuits. The “open” state is maintained until the module is restarted using the Start button.

The “muting” function cannot be activated by supplying the inhibition sensors unless the safety outputs have been switched on beforehand. To trigger the “muting” function, the inhibition devices must be activated within the 3 second time interval. During the activated “muting” phase, materials can be transported through the protection field without deactivating the safety outputs. In the event of intrusion into the hazardous zone, a person cannot activate the inhibition sensors in the same way and the system stops.

Whilst the “muting” function is activated, a “muting” status indicator light is controlled by the XPSLCM module. A fault at indicator light level (short-circuit, open circuit) is immediately recognised and deactivates the “muting” function. The indicator light only illuminates when a “muting” signal is generated and indicates the inhibition of the protection function.

### Conditions to be observed for the “muting” function

- The “muting” sensors must either be:
  - Thru-beam type, sensing distance 15 m: XUM2APCNL2 (or XUM2APCNM8) or XUM2BPANL2 or XUM2BPNL2.
  - Polarised reflex type, sensing distance 5 m: XUM9APCNL2 (or XUM9APCNM8) or XUM9BPANL2 or XUM9BPNL2 + XUZC50.
  - Polarised reflex type, sensing distance 11 m: XUX9APANT16 (or XUX9APANM12) or XUX9APBNT16 (or XUX9APBNM12) + XUZC50.
  - Limit switches
- $dM \leq m$  to obtain continuous validation of the “muting” function.
- Avoid the intrusion of persons during the “muting” phase. This phase is indicated by the indicator light connected to the “muting” indicator output of the XPSLCM module.
- A materials trolley must provide the “muting” signal before entering the protection field and cease it once it has cleared all the sensors of the protection field on exiting.

## Preventa safety modules types XPSTSA, XPSTSW

For safety time delays

### Operating principle

Safety modules **XPSTSA** and **XPSTSW** are used in applications requiring safety time delays:

- modules **XPSTSA** in applications with interlocking on high inertia machines with long rundown time (guards unlocked after safety time delay has elapsed),
- modules **XPSTSW** in applications with a safety switchover contact (shunting contact in association with XPSVN modules for zero speed detection, solenoid valve monitoring, etc.).

The time delay of safety circuits can be set to 16 preset values, using 2 selectors located on the front face of the modules.

To aid diagnostics, the modules have LEDs which provide information on the monitoring circuit status and 2 solid-state outputs for signalling to the process PLC. In addition, their removable terminal blocks optimise machine maintenance.

## Preventa safety modules types XPSDMB, XPSDME

For coded magnetic switch monitoring

### Operating principle

Safety modules **XPSDMB** and **XPSDME** are specifically designed for monitoring coded magnetic safety switches. They incorporate two safety outputs and two solid-state outputs for signalling to the process PLC. Conforming to Performance Level PL e/Category 4 conforming to EN/ISO 13849-1, modules **XPSDMB** can monitor two independent sensors and modules **XPSDME** can monitor up to six independent sensors.

To monitor a higher number of magnetic switches using these safety modules, the magnetic switches can be connected in series parallel, while meeting the requirements of Performance Level PL d/Category 3 conforming to standard EN/ISO 13849-1.

Safety modules **XPSDM●●●●P** incorporate removable terminal blocks, thus optimising machine maintenance. To aid diagnostics, the modules have LEDs on the front face which provide information on the monitoring circuit status.

## Preventa safety modules type XPSVNE

### For zero speed detection

3

#### Operating principle

Preventa safety modules **XPSVNE** for zero speed detection are used to detect the stop condition of electric motors. Their most common applications include: providing the unlock signal for electrically interlocked sliding or removable machine guards, controlling rotation direction signals for reversing motors and engaging locking brakes after a motor has come to a standstill.

As electric motors run down, a remanent voltage is produced in the windings of the motor due to residual magnetism. This voltage is proportional to the speed of the motor and, therefore, decreases as the motor comes to a standstill. This remanent voltage is measured in a redundant manner so as to detect the stop condition of the motor. The cabling between the motor windings and the inputs of the **XPSVNE** module is also monitored to prevent a cabling breakage or fault being seen as a stopped motor. A transformer should not be used to connect the motor to terminals Z1, Z2 and Z3 since there is no monitoring of the connection with the motor winding via the resistance monitoring.

Modules **XPSVNE** are suitable for detecting the stop condition of all types of AC or DC motor driven machines which, when the motor runs down, produce a remanent voltage in the windings due to residual magnetism. These machines can be controlled by electronic devices, such as variable speed drives or DC injection brakes. The input filters for standard **XPSVNE** modules are designed for a frequency of up to 60 Hz.

For motors operating at a frequency higher than 60 Hz, which therefore produce a high frequency remanent voltage, special modules **XPSVNE●●●●HS** should be used.

Modules **XPSVNE** have 2 potentiometers mounted on the front face of the module which allow independent adjustment of the switching threshold for each input circuit. This allows adjustment for different types of motors and application requirements.

To aid diagnostics, modules **XPSVNE** have 4 LEDs and 2 solid-state outputs to provide information on the status of the zero speed detection circuit.

XPSVNE●●●●●●

### Operating principle

When the cabin is parked at a landing, with the doors open, some lifts automatically correct their level (isolevelling) in relation to the landing in order to compensate for any differences generated by modification of the load in the cabin. During this operation, European standard EN/IEC 81 recommends that the presence of the cabin be checked within a zone of  $\pm 0.2$  m around the landing (door unlocking zone), by means of a safety circuit which will cause the cabin to stop if it moves out of the specified zone.

The use of the safety module **XPSEDA**, which checks the presence of the cabin in the specified zone at two points, meets this requirement. The module incorporates two safety outputs and two solid-state outputs for signalling functions. Four LEDs on the front face of the module provide visual indication of the status of the safety circuit.

The position of the cabin in relation to the landing is detected by two limit switches in the lift shaft. It is also possible to use non-contact sensors (magnetic sensors with reed contact).

When the cabin reaches the preset position and when it is within the permissible tolerances in relation to the landing, the two safety circuits in safety module **XPSEDA** close and allow isolevelling of the cabin with the doors open. Any change in one of the input signals (cabin outside the specified zone) or detection of a fault (break in the wiring, short-circuit, etc.) causes immediate opening of the safety outputs in the **XPSEDA** module and subsequent stopping of the cabin.

## Preventa safety module type XPSPVT

For dynamic monitoring of hydraulic valves on linear presses

3

### Operating principle

Safety module **XPSPVT** is specifically designed for monitoring hydraulic safety system valves which control the movements of potentially dangerous machines. The operating principle of this module is explained in the circuit diagram of a hydraulic safety system for linear presses (see below).

This hydraulic safety system features a 3 position piston which controls the up and down stroke of the operating cylinder. The circuit is equipped with a safety valve to complete the redundant system. This circuit must be activated to enable the up and down stroke of the cylinder.

If either of the 2 pistons becomes defective (for example, due to a broken spring or to oil contamination), and the valve piston shifts from its normal position towards the open position, the **XPSPVT** module will detect it and prevent resumption of the piston stroke.

Proximity sensors integrated in the valve to detect the piston positions and connected to the **XPSPVT** module must be damped when the valve coils are in the de-energised state (zero position).

The sensor circuits of the **XPSPVT** module are designed to allow connection of NPN and PNP proximity sensors or sensing components. Either 2-wire or 3-wire types can be used.

## Preventa safety modules type XPSPVK

For dynamic monitoring of double-bodied solenoid valves

### Operating principle

Safety module **XPSPVK** is specially designed for dynamic monitoring of the safety valves in eccentric presses, conforming to European standard EN 692.

This standard establishes the specifications related to safety control systems for presses equipped with friction clutches.

To meet the requirements of this standard, the clutch/brake control must be monitored dynamically.

This function is provided by a double-bodied solenoid valve (safety valve for presses) which performs the functions of two valves mounted in one body.

The position of the two valve pistons can be monitored by proximity sensors, mechanical limit switches or pressure switches.

Module **XPSPVK** checks for the correct operation of the double-bodied safety valves at 3 points in the cycle.

- Start at top dead centre: checks the rest position of the two valves.
- Take-on point (transfer function): checks that the two valves are in the "activated" (energised) position.
- Press stop trigger point: checks that the two valves return to the rest position.

Return must be simultaneous for both valves within a defined time period.

To set up an automatic disconnect of the **XPSPVK** module at the first machine stroke, a NC auxiliary contact mounted on the main control contactor or on another contactor/relay, activated at the same time, can be wired to terminals 7 and 8 in parallel with the RESET button.

If a fault is detected during the cycle, the **XPSPVK** module will stop the slide stroke and will also inhibit the start of another cycle.

# Monitor and Processing

## Preventa safety modules type XPSOT

For safety stop with automatic overtravel monitoring and control

### Operating principle

Safety module **XPSOT** is used on eccentric presses to monitor overtravel and ensure that the press slide stops in a non-dangerous position, i.e. top dead centre (TDC), during normal (non-emergency) operation.

Use of this module, designed in accordance with standard EN 692 relating to mechanical press safety, makes it possible to create a redundant, self-monitoring control system.

The two essential functions of this safety module are to:

- **Trigger the end of cycle stop sequences slightly before top dead centre (at point A) so as to come to a complete stop at TDC.**

After TDC, the permissible overtravel is approximately 10°. The safety module immediately detects any overtravel. Overtravel is indicative of braking device deterioration and, in this case, jog mode must be used to move the slide back to TDC. The next cycle will be inhibited to allow maintenance to be performed on the braking device (cam 1).

- Take over control monitoring during the dangerous part of the cycle (slide downstroke). Any stop instruction issued between TDC (0°) and point C (approximately 150° after TDC) causes an immediate stop of the press. **This approximate value of 150° corresponds to the 8 mm tool closure dimension (safety point).**

When a stop instruction is issued after this safety point, the press completes the cycle and comes to a complete stop at TDC (cam 2).

Control of the dangerous part of the cycle (generally the slide downstroke) is usually activated from a two-hand control station associated with a safety module (type **XPSBCE**).

Overtravel monitoring is performed **on each cycle** by safety module **XPSOT**.

### Operating principle (continued)

Press diagram

Control cams diagram

- 1 Permissible overtravel zone.
  - 2 Dangerous zone (usually slide downstroke).
  - 3 Non-dangerous zone (usually slide upstroke).
- S Permissible overtravel.
  - A Press stop trigger point.
  - B Point at which permissible overtravel is exceeded (a stop instruction issued after point B will lock up the press).
  - C Takeover point, beyond which the press will complete its cycle up to TDC.
  - TDC Top dead centre, actual stopping zone of the press.
  - BDC Bottom dead centre.

#### Cam operation

Cam 1 is associated with the OTS, limit switch (LS), cam 2 with the UN limit switch (the limit switches must be located on different cams for safety reasons).

The OTS limit switch is deactivated at TDC, at which point the UN limit switch is activated.

Point A1 of cam 1 is located approximately 300° after TDC and, when reached, the press stops and comes to a standstill: **A1 is the press stop trigger point.** Point B1, located approximately 10° after TDC, constitutes the end of cam 1: **If B1 is exceeded during stopping, the overtravel is abnormally long, the press locks up and the next cycle is inhibited.**

Point A2 of cam 2 functions like point A1 on cam 1 (contact state of the UN limit switch reversed in relation to the state of the OTS limit switch).

Point C2, located approximately 150° after TDC, corresponds to the 8 mm tool closing dimension. Stop instructions issued after C2 is reached are not executed until point A2 is reached.

Digital I/O modules

Analog I/O modules

Expert I/O modules

Functional Safety modules

Bus expansion modules

#### Presentation

The Modicon TM3 expansion module offer provides an opportunity to enhance the capabilities of Modicon M221, M241 and M251 logic controllers:

- Digital I/O modules which can be used to create configurations with up to 488 digital I/O (according to the controller). These modules are available with the same connections as the controllers.
- Analog I/O modules which can be used to create configurations with up to 114 analog I/O (according to the controller) and are designed to receive, amongst other things, position, temperature or speed sensor signals. They are also capable of controlling variable speed drives or any device equipped with a current or voltage input.
- Expert modules for control of TeSys motor starters which simplify wiring up the control section due to connection with RJ45 cables.
- Functional Safety modules which simplify wiring and can be configured in the SoMachine and/or SoMachine Basic softwares.

In addition, the TM3 expansion system is flexible due to the possibility of remotely locating some of the TM3 modules in the enclosure or another cabinet (up to 5 meters (16.404 ft.) away, using a bus expansion system.

The Modicon TM3 expansion system is common to the whole range of Modicon M221, M241 and M251 logic controllers, meaning that the model of controller can be revised without changing expansion module.

#### Modicon TM3 range

- Digital I/O modules**
- modules with 8 to 32 inputs/outputs:
    - 24 V or 120 V  $\pm$  50/60 Hz inputs
    - relay or transistor outputs

- Analog I/O modules**
- modules with 2 to 8 inputs/outputs:
    - current/voltage or temperature inputs
    - current/voltage outputs

- Expert module**
- module for control of one to four TeSys motor starters

- Functional Safety modules**
- modules designed using **Preventa** technology for integral machine safety:
    - control of emergency stops
    - control of switches
    - control of light curtains
    - control of pressure-sensitive mats or edges

- Bus expansion system**
- transmitter module
  - receiver module
  - bus expansion cable

#### Specific features

Modicon TM3 expansion modules have been designed with a simple interlocking assembly mechanism. A bus expansion connector is used to distribute data and the power supply when assembling the Modicon TM3 expansion modules with logic controllers.

#### Connections

A wide choice of connections is available depending on the model of Modicon TM3 module:

- removable screw terminal blocks (1)
- removable spring terminal blocks (1)
- HE 10 connector, to be used with HE 10 cables/bare wires or HE 10/HE 10 and Telefast sub-bases (2)

The connectors (screw terminal blocks, spring terminal blocks, HE 10 connector, RJ 45) are located on the front of the TM3 expansion modules and are therefore accessible.

(1) The terminal blocks are supplied with Modicon TM3 expansion modules.

(2) Telefast Modicon ABE7 pre-wired system to be ordered separately, visit our web site: [www.schneider-electric.com](http://www.schneider-electric.com)

## Modicon TM3 expansion modules

### Bus expansion system

#### Presentation

##### Modicon TM3 bus expansion system

A PLC configuration consists of a controller with its embedded input and output channels, used in conjunction with local or remote expansion modules which are used to increase the number of channels and/or functions.

- Expansion modules are connected directly by simple interlocking with the controller (local I/O) or remotely (remote I/O) with a TM3 bus expansion cable, up to 5 meters (16.404 ft.) away.
- The bus expansion connector, located on the side of the controllers and on each side of the Modicon TM3 expansion modules, transmits and synchronizes data.

3

- 1 Logic controller (M221, M221 Book, M241, M251)
- 2 Modicon TM3 digital I/O modules.
- 3 Modicon TM3 analog I/O modules.
- 4 Modicon TM3 expert module: control of TeSys motor starters.
- 5 Modicon TM3 functional safety modules.
- 6 Modicon TM3 bus expansion modules (transmitter and receiver).
- 7 TM3 bus expansion cable.

##### ■ Local I/O

Maximum configuration: 7 Modicon TM3 expansion modules associated with an M2●● logic controller. **(With limited number of relay or transistor outputs.**

##### ■ Remote I/O

Maximum configuration: 14 Modicon TM3 expansion modules (7 local modules + 7 remote modules) with the use of Modicon TM3 bus expansion system (transmitter and receiver modules).

The transmitter and receiver bus expansion modules can be used to:

- increase from 7 to 14 the number of I/O expansion modules that can be connected to an M2●● logic controller
- locate Modicon TM3 expansion modules remotely, up to 5 meters (16.404 ft.) away

The transmitter module and receiver module are physically linked by a **VDIP184546●●●** bus expansion cable, or any other shielded cable Cat 5E, F/UT.

##### Mounting

- Modicon TM3 expansion modules are mounted on a  $\perp$  symmetrical rail. They have a locking clip on the top of their casing.
- For plate or panel mounting, use the **TMAM2** kit.

(1) Depending on type of TM3 module used.

# Monitor and Processing

## Modicon TM3 functional safety modules

(Powered by *Preventa* technology)

3

### Presentation

Modicon TM3 functional safety modules are designed using Preventa technology. They can be used to incorporate machine safety into the overall machine control.

#### Data acquisition: control of safety products

- Emergency stop button: complementary protection measures
- Monitoring devices used in protective systems to control access to hazardous areas
- Light curtains and safety mats to detect intrusion into hazardous areas

#### Monitoring and processing

- Modicon TM3 functional safety modules control the input signals from monitoring devices and act as an interface with contactors and variable speed drives, causing the machine to stop.
- Modicon TM3 functional safety modules complement the embedded I/O on M221, M221 Book, M241 and M251 logic controllers.

Modicon TM3 functional safety modules	Safety system/Performance level reached
For control of emergency stops	Category 4 architecture / PL e, SIL3 
For control of switches	Category 4 architecture / PL e, SIL3 
For control of type 4 light curtains	Category 4 architecture / PL e, SIL3 
For control of pressure-sensitive mats or edges	Category 4 architecture / PL e, SIL3 

- The safety outputs available on the 4 modules are relay type, guided by microprocessor technology.
- Diagnostic utilities use LEDs, found on the module front face. They provide information on the monitoring circuit status.
- The diagnostic information is shared via the TM3 bus.
- The Start button monitoring function is configurable depending on the wiring.

### Connections

Equipped, depending on the model, with removable screw or spring-type terminals for connecting the safety channels.

### Configuration

Modicon TM3 functional safety modules connect to M221, M221 Book, M241 and M251 logic controllers according to the general rules for the TM3 system: 7 modules max. and 14 modules max. with the use of Modicon TM3 bus expansion system (transmitter and receiver).

### Mounting

- Modicon TM3 functional safety modules are mounted on a symmetrical rail.
- For plate or panel mounting, use the **TMAM2** kit.

### Description

#### Modicon TM3 functional safety modules

- 1 Adjacent module locking latch.
- 2 TM3 bus connectors (one on each side). These are designed to provide continuity of the link between connected modules.
- 3 symmetrical rail locking clip.
- 4 Display block (6 LEDs - green, red) for the module channels and diagnostics.
- 5 Removable spring or screw-type terminal blocks (depending on the model) for connecting the safety channels and the power supply.

### Presentation

Modicon TM3 transmitter and receiver modules can be used to:

- increase from 7 to 14 the number of TM3 I/O expansion modules that can be connected to an M2●● logic controller (1)
- locate Modicon TM3 expansion modules remotely, up to 5 m (16.404 ft.) away

The transmitter and receiver modules are physically linked by a **VDIP184546●●●** bus expansion cable, or any other shielded cable Cat 5E, F/UT.

### Mounting

- TM3 bus expansion modules are mounted on a  symmetrical rail.
- For plate or panel mounting, use the **TMAM2** kit.

### Description

#### TM3XTRA1 transmitter module

- 1 Block with 2 LEDs displaying the communication status and power supply status.
- 2 RJ 45 connector for connecting the **VDIP184546●●●** bus expansion cable, or any other shielded cable Cat 5E, F/UT.
- 3 Screw terminal for the functional ground (FG) connection.
- 4  symmetrical rail locking clip.
- 5 TM3 bus connector providing continuity of the link with the connected module.
- 6 Adjacent module locking latch.

#### TM3XREC1 receiver module

- 1 Block with 2 LEDs displaying the communication status and power supply status.
- 2 RJ 45 connector for connecting the **VDIP184546●●●** bus expansion cable, or any other shielded cable Cat 5E, F/UT.
- 3 Screw terminal block for connecting the power supply.
- 4  symmetrical rail locking clip.
- 5 TM3 bus connector providing continuity of the link with the connected module.
- 6 Adjacent module locking latch.

(1) It is not possible to use the bus expansion system Modicon TM3 if one or more Modicon TM2 expansion modules are used in the configuration.

**Presentation**

**Operating principle**

Preventa safety controller modules XPSMP are designed for a Performance Level of up to PL e/Category 4 conforming to standard EN/ISO 13849-1.

They enable two independent safety functions (selected from a choice of 15 pre-defined configurations) to be performed using the same product. Configuration selection is easily made using 3 buttons on the front face of the module.

These 15 pre-programmed safety functions provide a solution for the majority of safety applications, for example: monitoring Emergency stops, limit switches, safety mats and sensing edges, enabling switches, coded magnetic switches, type 4 safety light curtains conforming to EN 61496-1.

Safety controllers XPSMP incorporate 6 safety outputs (3 per function) and 3 solid-state signalling outputs for signalling to the process PLC.

To aid diagnostics, the modules have LEDs on the front face which provide information on the monitoring circuit status. They also indicate and assist selection of the 2 required configurations.

**Maximum achievable safety level**

- PL e/Category 4 conforming EN ISO 13849-1,
- SILCL 3 conforming to EN/IEC 61508 and EN/IEC 62061

**Product certifications**

- UL
- CSA
- TÜV

	Configuration	Synchronisation time	Type of start (1)		Start test	Notes
			Automatic or unmonitored	Monitored		
Functions disabled	0	–	–	–	–	Factory setting
Emergency stop monitoring, 1-channel wiring (category 2)	1	–	X	–	–	–
	2	–	–	X	–	–
Emergency stop monitoring, 2-channel wiring, or guard monitoring (category 4)	3	Unlimited	X	–	X	–
	4	Unlimited	–	X	X	–
	5	1.5 s	X	–	X	–
	6	1.5 s	–	X	X	–
	7	Unlimited	X	–	–	–
	8	Unlimited	–	X	–	–
Guard monitoring for injection press or blowing machine (category 4)	9	1.5 s	–	X	X	Uses both safety outputs (2)
Enabling grip switch monitoring (3 position switch) (category 4)	10	–	X	–	X	The start button acts as start-up preparation
Sensing mat and edges monitoring (category 3)	11	–	X	–	–	Mats with circuit making contacts
	12	–	–	X	–	
Relay output safety light curtain monitoring (category 4)	13	0.5 s	–	X	X	–
Coded magnetic switch monitoring (category 4)	14	1.5 s	X	–	–	Magnetic switches with 2 contacts, 1 NO and 1 NC
	15	1.5 s	–	X	–	

(1) Automatic start: there is no contact or it is shunted.  
 Unmonitored start: The output is activated on closing of the start contact.  
 Monitored start: the start input is monitored so that there is no start-up in the event of the start contact being shunted or the start circuit being closed for more than 10 seconds.  
 Start-up is triggered following activation of the start button (push-release function) on opening of the contact.

(2) Tool zone guard with 3<sup>rd</sup> switch.  
 Additional rear guard (optional) with automatic start. The opening of the guard cuts all outputs.

## Preventa configurable safety controllers

### Type XPSMC

3

XPSMC16ZC

XPSMC32ZC

### Presentation

Configurable safety controllers **XPSMC●●Z●** are designed to provide a solution for safety applications requiring conformity to Performance Level PL e/Category 4 EN/ISO 13849-1 and SIL 3 EN/IEC 61508.

The range of configurable safety controllers comprises 6 products, each with different technical characteristics.

Configurable controllers	Safety inputs	Safety outputs (1)	Communication via		
			CANopen bus	Profibus bus	Modbus serial link
XPSMC16Z	16	6 + 2 x 2	–	–	Yes, slave
XPSMC16ZC	16	6 + 2 x 2	Yes, slave	–	Yes, slave
XPSMC16ZP	16	6 + 2 x 2	–	Yes, slave	Yes, slave
XPSMC32Z	32	6 + 2 x 2	–	–	Yes, slave
XPSMC32ZC	32	6 + 2 x 2	Yes, slave	–	Yes, slave
XPSMC32ZP	32	6 + 2 x 2	–	Yes, slave	Yes, slave

### Line control

The safety inputs are supplied by the various control outputs (2), in such a manner so as to monitor for short-circuits between the inputs, short-circuits between each input and earth or the presence of residual voltages.

The controller, assisted by the control outputs, continuously tests all the connected inputs. As soon as an error is detected on an input, all the outputs associated with this input are disconnected. Safety outputs associated with other inputs remain active.

### Configuration

Safety controllers **XPSMC●●Z●** are configurable and addressable using software **XPSMCWIN** running on a PC. Connection accessories required: see page 3/109.

### Connections

For connection of safety inputs and outputs, safety controllers **XPSMC●●Z●** can be fitted with a choice of: screw connectors type **XPSMCTS●●**, or spring clip connectors type **XPSMCTC●●**.

These connectors are to be ordered separately, see page 3/109.

### Safety functions

Configuration of the safety functions is carried out using software **XPSMCWIN** which is available on the Safety Suite V2 CD-ROM.

**30 certified safety functions** are available with this software and they are easily assignable to the safety outputs. The safety functions have multiple combination possibilities and various starting conditions.

The safety functions are:

- certified in accordance with EN/ISO 13849-1 and IEC 61508,
- configurable in controller XPSMC using software **XPSMCWIN** which is available on the Safety Suite V2 software pack.

All 8 safety outputs are suitable for use in safety related parts of control systems conforming to Performance Level PL e/Category 4 in accordance to EN/ISO 13849-1.

### Main safety functions

- Emergency stop monitoring, with or without time delay, 1 or 2-channel wiring
- Two-hand control (type III- A and C conforming to EN 574/ISO 13851)
- Guard monitoring with 1 or 2 limit switches
- Guard monitoring for injection presses and blowing machines
- Magnetic switch monitoring
- Sensing mat monitoring
- Light curtain (type 4 conforming to EN/IEC 61496, relay or solid-state output) monitoring
- Zero speed detection
- Dynamic monitoring of hydraulic valves on linear presses
- Monitoring safety stop at top dead centre on eccentric press
- Safety time delays
- "Muting" function of light curtains
- Enabling switch monitoring, 2 or 3 contact
- Hydraulic press
- Eccentric press
- Foot switch monitoring
- Chain shaft breakage monitoring
- Position selector

### Application schemes and functional diagrams

See instruction sheet on [www.schneider-electric.com](http://www.schneider-electric.com)

(1) 8 independent safety outputs = 6 solid-state safety outputs + 2 x 2 relay outputs (4 relay outputs with mechanically linked contacts).

(2) 8 control outputs are available but they are not safety outputs.

### Communication

#### CANopen fieldbus

Configurable safety controllers **XPSMC●●ZC** incorporate a SUB-D 9-pin male connector for direct connection on CANopen bus.

CANopen bus is an open bus that ensures deterministic and reliable access to the real-time data of automation equipment. The bus uses a shielded dual twisted pair on which a maximum of 127 devices can be connected by chaining.

The baud rate varies between 10 Kbps and 1Mbps depending on the length of the bus (5000 m/16404.15 ft to 20 m/65.62 ft).

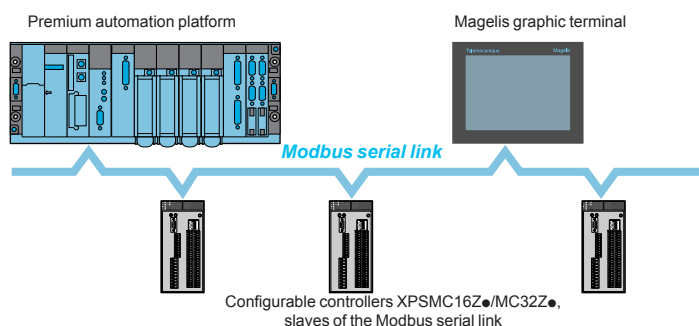

#### Profibus bus

Configurable safety controllers **XPSMC●●ZP** incorporate a SUB-D 9-pin male connector for connection on Profibus bus.

Configurable safety controllers **XPSMC●●ZP** are slaves on the Profibus bus.

Profibus bus is a fieldbus that meets industrial communication requirements. The topology of the Profibus bus is of the linear type with a centralised master/slave type access procedure. The physical link is a single shielded twisted pair.

#### Modbus serial link

Configurable safety controllers **XPSMC●●Z●** incorporate a Modbus communication interface (RJ45 connector) for configuration and diagnostics.

This interface enables connection of the controllers to:

- a PC (configuration),
- a PLC (diagnostics), or
- an operator dialogue terminal (diagnostics).

The Modbus serial link comprises a master station (Premium automation platform) and slave stations (configurable controllers **XPSMC16/32Z●**).

Two exchange mechanisms are possible:

- **Question/response**: the questions from the master are addressed to a given slave. The response is expected by return from the interrogated slave.
- **Distribution**: the master distributes a message to all the stations of the Modbus serial link. The latter execute the order without transmitting a reply.

### Description

#### Configurable safety controller XPSMC●●Z●, with screw connectors

##### Front face

- 1 LED display and system diagnostics.
- 2 Two LEDs for CANopen or Profibus (1) connection status.
- 3 SUB-D 9-pin male connector for connection on CANopen bus (**XPSMC16ZC/MC32ZC**) or SUB-D 9-pin female connector for connection on Profibus bus (**XPSMC16ZP/MC32ZP**).
- 4 Solid-state safety output and "muting" indicator light terminals.
- 5 Power supply (24 V  $\overline{DC}$ ) and relay safety output terminals.
- 6 Control output terminals for power supply to safety inputs and safety input terminals.
- 7 RJ45 connector for connection on Modbus serial link.
- 8 RESET button (resetting of controller).

##### Rear face:

- 9 Fixing plate for mounting on rail.

(1) Depending on controller model.

### General overview

Maximize your business and machine performance with MachineStruxure

3

Machine builders like you are constantly looking for new ways to design and build more innovative machines in less time and at lower cost. MachineStruxure™ can help.

The NEXT generation of MachineStruxure is a complete machine automation solution that provides flexible and scalable machine control, ready-to-use architectures, efficient engineering solutions, and comprehensive customization and engineering support services. It can help you meet your challenges for improved efficiency and greater productivity, as well as allow you to deliver higher added value to your customers throughout the entire machine life cycle.

### Safety Chain Solutions

Save time by using the ready to use, and easy to adapt **certified Safety Chain Solutions**: the design of the machine, the re-use of the provided documentation with wiring diagram and documented calculations, for ease with the certification process.

### Solution Breakdown

- 1 Harmony XALK emergency stop
- 2 OsiSense safety limit switches
- 3 Phaseo power supply 24 V AC
- 4 Preventa XPSMCM modular safety controller
- 5 Harmony signaling and control devices
- 6 TeSys D contactor
- 7 Harmony XY2SB two-hand control station

### General overview

#### Improve efficiency

#### Flexible and scalable performance

Schneider Electric offer is covering all the safety functionality and scalability you need for your machine to improve efficiency:

- > Single function offer designed for standalone machines
- > Multi functional offer designed for standalone machines
- > Multi functional offer designed for machine lines with safe distributed architectures

Performance

#### Multi-function distributed

#### Multi-function

#### Single function

Standalone

Embedded Safety Network

#### Increase profitability

#### Everything you need is embedded

Up to Cat. 4, PL e, SIL3

- > Find the exact match to your specifications
- > Optimize your configuration
- > Save space in a cabinet with less components
- > Expand from small to large configuration by a wide range of expansion and communication modules
- > Build up to 6 island architectures via safe communication up to 50 m between each island

Screw removable connector

Mini USB 2.0 configuration port

Communication via the expansion bus connector

+ Network and Machine bus: Ethernet IP, Universal Serial Bus (USB), Modbus TCP

## Preventa modular safety controller

### type XPSMCM

#### General overview

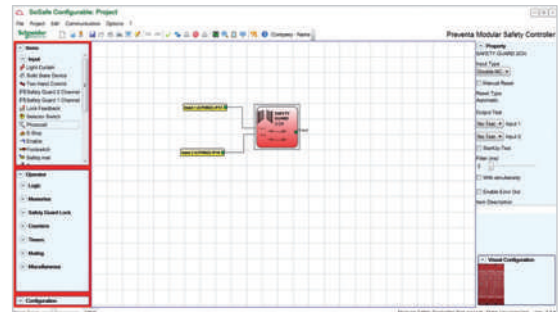

Reduce your time to market

Intuitive automation with SoSafe Configurable

Easy configuration using intuitive software SoSafe Configurable

#### Configuration

- 1 Define hardware module configuration
- 2 Create project configuration by drag and drop of function blocks and assignment of inputs and outputs

#### Online visualization & testing

- > Validate software configuration
- > View configuration behavior by online visualization in graphic or text views

#### Commissioning

- > Use project documentation to support the wiring and safety calculation to complete the commissioning

**Preventa Modular Safety Controller**

Project Report generated by SoSafe Configurable version 1.3.4

Project Name: Preventa  
 Client: Schneider Electric  
 Company: Schneider Electric  
 Date: 21.02.2018 08:39:25  
 Subsystem: CSD

Module Safety Controller: Configuration  
 Module CSD102 (Configured Firmware version: FW v 2.0)  
 Module CSD102 (Current Required Firmware version: 2.0)  
 Module CSD102 (Minimum Required Firmware version: 2.0)  
 Operating from Memory: user Disabled: True

Module Safety Controller: Safety Information  
 STPA (according to IEC 61508-1): 1.4E-08 (1/a)  
 STPL (according to IEC 61508-1): 175 years  
 Sdavg (according to IEC 61508-1): 89.55 %

The STPA value is calculated with respect to the failure rate of all the components with exclusion of external relays. The main relay output is not taken into account in the STPA calculation. The STPA value is calculated with respect to the failure rate of all the components with exclusion of external relays. The main relay output is not taken into account in the STPA calculation. The STPA value is calculated with respect to the failure rate of all the components with exclusion of external relays. The main relay output is not taken into account in the STPA calculation.

Assumptions:  
 This definition of STPA and of the other related parameters as per IEC 61508-1, only refers to the hardware implemented in the Preventa Safety Controller system by the SoSafe configuration software. Security configuration has been performed manually. The actual STPA of the entire application and the relative parameters must consider data for all the devices connected to the Preventa Safety Controller system within the scope of the application. This task and any other aspect of system configuration are the exclusive responsibility of the user/installer.

The final STPL value, taking in account data for all the devices connected to the system, must always be calculated to 100 years if not:

Resources used  
 I/O: 124 (1/24)  
 Function Blocks: 2  
 Total number blocks: 18 (1/18)

STPA: 1.4E-08  
 STPL: 175 (1/175)  
 Sdavg: 89.55 (1/89.55)

# Monitor and Processing

## Preventa modular safety controller type XPSMCM

### System components

3

#### General presentation

The Preventa modular safety controller type XPSMCM is a modular configurable safety controller able to monitor multiple safety functions on and around a machine to minimise the risk of people accessing the dangerous moving parts of the machine.

This modular safety controller is designed for monitoring safety functions such as:

- > Emergency Stop
- > Guard Monitoring
- > Perimeter Guarding
- > Position Monitoring
- > Speed Monitoring
- > Enabling Movement

with input devices such as emergency stop pushbuttons, safety guard and limit switches, safety foot switches, safety light curtains and laser scanners, safety mats, safety encoders and proximity sensors, two-hand control stations and enabling switches.

#### XPSMCM system applications

The XPSMCM system offers numerous advantages compared to traditional safety modules, such as:

- > The hardware architecture of expansion modules and layout can be designed according to the machine specification and thus reduces the number of components and the footprint and wiring
- > Simplify input and output wiring by software configuration combining multiple functions together
- > Allowing machine scalability from 8 inputs and 2 outputs and up to 128 inputs and 16 outputs with the expansion modules connected directly to the controller or distributed among 6 islands
- > Connected everywhere with wide range of communication expansion modules
- > Provided with intuitive software for logical configuration, online visualization and testing, and commissioning
- > Simplification of machine maintenance through removable memory card, which can be used to transfer the configuration to a new controller without software

#### XPSMCM system components

The XPSMCM system is composed of:

- > A safety controller CPU, which can be used as standalone or together with expansion modules
- > Safe expansion modules: digital input modules, solid state and relay output modules, or mixed input/output modules
- > Safe speed monitoring modules for proximity sensors and safety encoders: Sin/Cos
- > Safe communication expansion modules for safe island creation
- > Non-safe communication modules: interfaces to network (Modbus TCP, Ethernet IP)
- > A configuration software: SoSafe Configurable
- > A memory card, available for saving configuration data for ease of maintenance and controller setup
- > Expansion bus connectors, for connecting safe modules to the safety controller CPU

#### Configuration software

The modular safety controller XPSMCM is supported by a completely intuitive software: **SoSafe Configurable**.

The software follows a simple drag and drop function block approach to configuration and is completed with a library of configurable safety functions and logical functions as well as easy to use tools for:

- > online configuration monitoring
- > configuration validator
- > hardware device scanner
- > printable schematics and documentation

SoSafe Configurable supports a quick and easy setup of the machine.

## Preventa modular safety controller type XPSMCM

### Certification – Directive and standards

#### General presentation

##### XPSMCM system certification

The XPSMCM system is certified by TÜV SÜD meeting the industrial safety standards of Category 4, PL e according to EN/ISO 13849-1 and SILCL 3 according to IEC/EN 61508 and IEC/EN 60261.

##### Directive and standards

**Preventa modular safety controller type XPSMCM complies with the following directives and standards.**

Directives and standards	Subject
2006/42/EC	Machinery Directive
2004/108/EC	Electromagnetic Compatibility (EMC)
2006/95/EC	Low Voltage Directive (LVD)
IEC/EN 61131-2	Programmable Controllers– Part 2: Equipment requirements and tests
EN/ISO 13849-1	Safety of machinery: Safety-related parts of control systems – Part 1: General principles for design
EN/ISO 13849-2	Safety of machinery: Safety-related parts of control systems – Part 2: Validation
EN 61496-1 (Type 4)	Safety of machinery: Electro-Sensitive Protection Equipment, Part 1: General requirements and tests
IEC/EN 62061	Safety of machinery – Functional safety of safety-related electrical, electronic and programmable electronic control systems
EN 61508-1	Functional safety of electrical, electronic and programmable electronic safety-related systems – Part 1: General requirements
EN 61508-2	Functional safety of electrical, electronic and programmable electronic safety-related systems – Part 2: Requirements for electrical, electronic and programmable electronic safety – related systems
EN 61508-3	Functional safety of electrical, electronic and programmable electronic safety-related systems – Part 3: Software requirements
IEC 61784-3	Industrial communication networks – Profiles – Part 3: Functional safety field buses – General rules and profile definitions
CE for Europe, cULus mark for USA and Canada	

# Monitor and Processing

## Preventa modular safety controller

### type XPSMCM

#### System components

3

#### Flexibility and scalability

The modular safety controller type XPSMCM provides flexibility and scalability starting with the main unit: the safety controller **XPSMCMCP0802**.

- > It embeds 8 safety digital inputs, 2 OSSD pairs and 2 status outputs. It is an appropriate solution for machines with a small number of safety functions requiring the configuration flexibility of a safety controller.
- > The safety controller **XPSMCMCP0802** can be used:
  - as standalone
  - and also with 14 expansion modules: the system is expandable up to 128 inputs and 16 outputs, ideal for machines requiring multiple safety function monitoring
- > Distributed architecture: it is possible to connect 6 islands up to 50 meters apart (164.04 ft.), using the safe expansion bus.

#### Expansion of the XPSMCM system

- > Minimum size of hardware: a safety controller **XPSMCMCP0802** is used as standalone.

> 8 safety digital inputs + 2 OSSD pairs + 2 status outputs

- > Maximum size of hardware: a safety controller **XPSMCMCP0802** connected to 14 expansion modules via the expansion bus connectors.

> 128 inputs and 16 OSSD pairs + 16 status outputs

#### Key figures of the XPSMCM system

Each of the XPSMCM system components are compact designed: a single module dimensions are 22.5 x 99 x 114.5 mm (0.89 x 3.9 x 4.51 in.), size of a typical safety relay.

The safe components are red colored and equipped with:

- 1 Removable screw-type terminal blocks for connecting the safety channels and/or the power supply
- 2 Slot for a memory card (only on safety controller)
- 3 L-shaped symmetrical rail locking clip
- 4 Slot for expansion bus connectors
- 5 LEDs displaying the status (I/O, communication, power supply, reset, ...)
- 6 Protective cover
- 7 Mini USB 2.0 connector for configuration (only on safety controller)

The non-safe components are black colored and equipped with:

- 8 Removable screw-type terminal blocks for connecting the power supply
- 9 L-shaped symmetrical rail locking clip
- 10 LEDs displaying the status (I/O, communication, power supply, reset, ...)
- 11 Specific connector for connecting to the machine bus or network (depending on model) (see page 3/118)
- 12 Mini USB 2.0 connector for configuration

Safe components

Expansion bus connectors

Non safe components: non-safe communication modules

# Monitor and Processing

## Preventa modular safety controller type XPSMCM

### System components

#### Flexibility and scalability

##### Safe communication with decentralized I/O's

The safety controller CPU has the possibility to create up to 6 decentralized safety related islands with a distance of 50 meters (164.04 ft.) between each island on a single Safety controller CPU.

- > The safety controller CPU, the expansion modules and the safe communication expansion modules communicate safely through the use of the expansion bus performed with the expansion bus connectors which are physically located on the back of each safe module.
- > The safe communication expansion modules are used in order to create safe decentralized islands (cabinets); they are connected in a line or tree configuration.
- > The islands can be expanded to 50 meters (164.04 ft.) between islands and use RS 485 cabling.
- > The order of the safe expansion modules connected with the expansion bus connectors is not important, the configuration automatically recognizes the architecture based on the module addressing.

#### Ethernet

#### Safety related communication

— RS 485 serial interface shielded cable (up to 50 m / 164.04 ft.) between two decentralized islands)

- 1 Safety controller CPU
- 2 Safe communication expansion modules (line configuration)
- 3 Safe expansion modules: mixed I/O modules, Safe relay output modules, Safe speed monitoring modules for proximity sensors and safety encoders

#### Non-safety related communication

- 4 Non-safe communication modules: interfaces to network (Ethernet IP, ModbusTCP), for non-safety related communication
- 5 Modicon TM4 communication module (Ethernet switch module)
- 6 Modicon M241 logic controller
- 7 Modicon TM3 expansion I/O module

### Safety controller, expansion modules

mini USB 2.0 connector for configuration

Safety controller CPU

3

#### XPSMCM system components

##### Safety controller

The safety controller XPSMCMCP0802 is designed to monitor a safety configuration.

Its configuration is created using the software SoSafe Configurable.

The safety controller CPU is also usable as a standalone device or able to be connected to any of the expansion units of the XPSMCM system such as I/O expansion modules, relay output modules, communication expansion modules, speed monitoring modules and non-safe fieldbus communication modules.

##### The safety controller features:

- > A configuration memory card (optional)
- > A LOG file containing the last 5 configuration modifications in chronological order, with date of modification
- > 24 terminals in 22.5 mm (0,89 in.)
- > Connection with other expansion modules via the expansion bus connectors (sold separately)
- > mini USB 2.0 connector for configuration

Safety controller reference	Description
XPSMCMCP0802	<ul style="list-style-type: none"> <li>&gt; 8 safety digital inputs</li> <li>&gt; 2 OSSD pairs with 400 mA output current</li> <li>&gt; 4 test outputs for line control monitoring of input circuits</li> <li>&gt; 2 inputs for Start/Restart interlock and external device monitoring (EDM)</li> <li>&gt; 2 configurable status outputs</li> </ul>

##### Expansion modules

6 types of expansion modules are available, designed for safety inputs or outputs.

The safety inputs/outputs are configurable individually or in pairs, with several possibilities:

- > Monitoring using line control monitoring via dedicated test outputs
- > Configurable filters and delays for each single input
- > Configurable output activation and de-activation delays
- > Independent control of pairs of outputs
- > Configurable diagnostic output signals
- > Simple diagnostics via front led signalling, configuration software, communication expansion modules

Safe relay output modules

### XPSMCM system components

#### Safe relay output modules

4 types of safe relay output modules are available.

Safe relay output module reference (item)	Description
XPSMCMER0002 (1)	<ul style="list-style-type: none"> <li>&gt; 2 forcibly guided contact safety relay output (2 NO + 1 NC) modules for 1 output without expansion bus connection</li> <li>&gt; 1 input for Start/Restart interlock and external device monitoring (EDM)</li> </ul>
XPSMCMER0004 (2)	<ul style="list-style-type: none"> <li>&gt; 4 forcibly guided contact safety relay output (2 NO + 1 NC) modules for 2 independent outputs without expansion bus connection</li> <li>&gt; 2 inputs for Start/Restart interlock and external device monitoring (EDM)</li> </ul>
<ul style="list-style-type: none"> <li>&gt; The safe relay output modules XPSMCMER000● do not require the expansion bus connectors as they are directly wired to the selected OSSDs.</li> </ul>	
XPSMCMRO0004 (3)	<ul style="list-style-type: none"> <li>&gt; 4 forcibly guided contact safety relay output modules with expansion bus connection</li> <li>&gt; Expansion module with 4 independent safety relay outputs and the corresponding 4 inputs for the external feedback contacts (EDM)</li> <li>&gt; The relay can be configured according to Category 1, 2 and 4 architectures</li> </ul>
XPSMCMRO0004DA (4)	<ul style="list-style-type: none"> <li>&gt; 4 forcibly guided contact safety relay output modules with expansion bus connection</li> <li>&gt; Expansion module with 4 independent safety relay outputs and the corresponding 4 inputs for the external feedback contacts (EDM)</li> <li>&gt; The relay can be configured according to Category 1, 2 and 4 architectures</li> <li>&gt; 8 configurable status outputs</li> </ul>
<ul style="list-style-type: none"> <li>&gt; The safe relay output modules XPSMCMRO000● are connected to the safety controller CPU via the expansion bus connectors.</li> </ul>	

#### Safe speed monitoring modules

The safe speed monitoring modules are designed to monitor zero speed control, max speed (limited speed), speed range and direction.

- > Up to four logically selectable limited speed thresholds (freely configurable via SoSafe Configurable software) for each logical input (axis)
- > The safe speed monitoring modules (excluding XPSMCMEN0200) are equipped with RJ 45 connectors (1 or 2 depending on the model) for encoders and terminal blocks for proximity switches
- > Max input frequency: 500 kHz for encoder monitoring and 5 kHz for proximity sensors
- > The modules can be configured with incremental encoders and PNP/NPN proximity switches as described below:

Safe speed monitoring module reference (item)	Description	Connector type
XPSMCMEN0100SC (1)	> 1 input for Sin/Cos encoder + 1 or 2 proximity switches	1x RJ 45 (ENC1) and terminal blocks for proximity sensor wiring
XPSMCMEN0200SC (2)	> 1 or 2 inputs for Sin/Cos encoders + 1 or 2 proximity switches	2x RJ 45 (ENC1/ENC2) and terminal blocks for proximity sensor wiring
XPSMCMEN0200 (3)	> 2 inputs for proximity switches	Terminal blocks for proximity sensor wiring

- > The safe speed monitoring modules are connected to the safety controller CPU via the expansion bus connectors.

### XPSMCM system components

#### Safe communication expansion modules

The safe communication expansion modules enable the connection of XPSMCMCP0802 modular safety controller with the expansion modules placed at distances,  $\leq 50$  m ( $\leq 164$  ft.).

Using RS 485 shielded cable two XPSMCMCO0000S modules placed at the desired distance can be linked together thus joining the expansion modules to the Modular Safety Controller.

- > Each XPSMCMCO0000S2 safe communication expansion module has 2 independent connection channels; typically used in between 2 XPSMCMCO0000S1 modules.
- > The XPSMCMCO0000S1 safe communication expansion module has only one channel connection for transmitting/receiving data and must be connected as the first or last module.
- > Up to 6 islands can be created using the safe communication modules with a total length of 250 meters (820.2 ft.) and a maximum of 50 meters (164 ft.) between two safe communication modules. The system response time does not change with the use of the safety communication modules.

Safe communication expansion module reference (item)	Description
XPSMCMCO0000S1 (1)	> 1 connection interface: single channel transmitter/receiver (1)
XPSMCMCO0000S2 (2)	> 2 connections interface: dual channel transmitter/receiver

(1) End of the network or Start of the network if connected to a single RS 485 cable

#### Non-safe fieldbus communication modules

The non-safe communication modules are designed for diagnostics connection and data communication purposes to machine field bus or network systems.

non-safe communication module reference (item)	Machine bus/network interface	Connector type
XPSMCMCO0000EI (1)	> Ethernet IP	1x RJ 45 (in/out)
XPSMCMCO0000EM (2)	> Modbus TCP	1x RJ 45 (in/out)
XPSMCMCO0000UB (3)	> Universal Serial Bus	Mini USB

- > The non-safe communication modules are connected to the safety controller via the Expansion bus connector. Each of them have a mini USB 2.0 connector for configuration
- > Only one non-safe communication module type can be connected on a safety controller.

Non-safe communication modules

Memory card

Expansion bus connector

SoSafe Configurable software

### XPSMCM system components

#### Accessories

##### ■ Memory card

**XPSMCMEM0000** is a removable memory card that can be used to save XPSMCM configuration data for subsequent transfer to a new device without using a PC.

- > The configuration in the XPSMCMEM0000 overwrites any other configuration present on the safety controller CPU XPSMCMCP0802, replacing this with that contained in the card.
- > This configuration replacement function can be disabled on the safety controller CPU via SoSafe Configurable software.
- > Overwrite operations are recorded in chronological order in the safety controller CPU XPSMCMCP0802 LOG file.

##### ■ Expansion bus connector

**XPSMCMCN0000SG** is an expansion bus connector:

- > It provides a safe communication between safe expansion components and the safety controller CPU.
- > Only the XPSMCMCP0802 safety controller CPU requires the purchase of the expansion bus connector. Each expansion module is provided with one expansion bus connector.

##### ■ Configuration cable

**TCSXCNAMUM3P** is a configuration cable to be used for software configuration between a PC, the safety controller CPU, and to the fieldbus communication modules.

- > Length 3 m (9.84 ft.)
- > It is equipped with USB connectors: USB A and USB mini B

##### ■ Safe communication cable

- > RS 485 serial interface shielded cable are used between the safe communications expansion modules to create up to 6 decentralized safety related islands
- > Available lengths: 10 to 50 m (32.81 to 164.04 ft.)

##### ■ Encoder splitter cable

- > The encoder splitter cable enables the connection of an embedded encoder within the PacDrive M motion system to the speed monitoring module of the modular safety controller
- > Available lengths: 1 to 5 m (3.3 to 16.4 ft.)

#### Software

The SoSafe Configurable software, installed on a PC, is used to create complex logical conditions using logical operators and safety functions, such as muting, timer, counters, memories, etc. via a simple and intuitive graphic configuration interface. Configuration data are transferred to the safety controller CPU XPSMCMCP0802 via a USB link.

### Safe expansion modules

#### Safe communication expansion modules

Description	Characteristics	Connector type	Reference	Weight kg/lb
Safe RS 485 bus expansion module for remote extension	1 connection interface: single channel transmitter/receiver network connection	Screw	XPSMCMCO0000S1	0.300 0.66
	2 connections interface: dual channel transmitter/receiver network connection	Screw	XPSMCMCO0000S2	0.300 0.66

#### Non-safe communication modules

Description	Field bus / network type Connector type	Connector type	Reference	Weight kg/lb
Non-safe communication modules	<input checked="" type="checkbox"/> Ethernet IP <input type="checkbox"/> 1x RJ 45 (in/out)	Screw	XPSMCMCO0000EI	0.300 0.66
	<input checked="" type="checkbox"/> Modbus TCP <input type="checkbox"/> 1x RJ 45 (in/out)	Screw	XPSMCMCO0000EM	0.300 0.66
	<input checked="" type="checkbox"/> Universal Serial Bus <input type="checkbox"/> 1x Mini USB	Screw	XPSMCMCO0000UB	0.300 0.66

### Accessories

Description	Application	Reference	Weight kg/lb
Expansion bus connector (1)	For connecting the various expansion modules to the safety controller CPU	XPSMCMCN0000SG	0.001 0.002
Memory card	For saving configuration data for subsequent transfer to a new device without using a PC	XPSMCMME0000	0.004 0.009

Description	Use	Length	Reference	Weight kg/lb
Configuration cable	For software configuration, between a PC, the safety controller CPU, and to the fieldbus communication modules Equipped with 2x USB connectors: USB A and USB mini B	3 m / 9.84 ft	TCSXCNAMUM3P	0.065 0.143
		10 m / 32.81 ft	TSXSCMCN010	0.920 2.03
RS 485 shielded cables	Between two safe communication expansion modules	25 m / 82.02 ft	TSXSCMCN025	2.300 5.07
		50 m / 164.04 ft	TSXSCMCN050	4.600 10.14
		1 m / 3.3 ft	TSXESPPM001	0.110 0.24
Encoder splitter cables	Between SIN/COS safe speed monitoring module and PacDrive M drives and the associated servo motors	3 m / 9.84 ft	TSXESPPM003	0.310 0.68
		5 m / 16.40 ft	TSXESPPM005	0.510 1.12
		1 m / 3.3 ft	TSXESPP3001	0.150 0.33
Encoder splitter cables	Between SIN/COS safe speed monitoring modules and Lexium 62 (PacDrive 3), Lexium 32 servo drives and the associated servo motors	3 m / 9.84 ft	TSXESPP3003	0.450 0.99
		5 m / 16.40 ft	TSXESPP3005	0.750 1.65

(1) This reference needs to be ordered for the XPSMCMCP0802 reference only when it is connected to expansion modules.

# Monitor and Processing

## Preventa modular safety controller type XPSMCM

Configuration software: SoSafe Configurable

3

### Configuration software: SoSafe Configurable

SoSafe Configurable is used to create complex logical conditions using logical operators and safety functions, such as muting, timer, counters, memories, etc. via a simple and intuitive graphic configuration interface. Configuration data are transferred to the safety controller XPSMCMCP0802 via a USB link.

- > XPSMCMCP0802 safety controller has a mini USB 2.0 connection to connect to a PC where the **SoSafe Configurable** software is installed.
- > An application held on XPSMCMCP0802 safety controller can be saved on the memory card (optional) for fast transfer of the configuration data to other modules.

#### Password

The SoSafe Configurable software is protected with 2 levels of alphanumerical password (max 8 characters.)

- > The level 1 password is an operation and maintenance password. It allows only to view the LOG file, the composition of the system and use the real time MONITOR.
- > The level 2 password enables all features of the software to be accessible. Allowing to load, modify, save, and download (from the PC to XPSMCMCP0802 safety controller) a project configuration.

#### LOG file (Level 1 password).

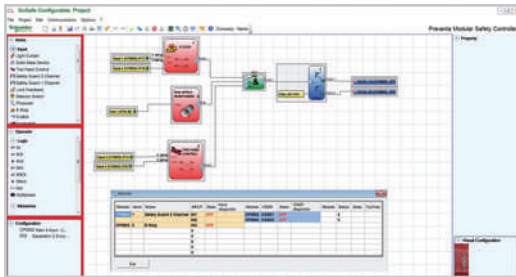

A log file with the creation date and CRC checksum (4-digit hexadecimal identification) of a project are stored in the safety controller CPU.

- > A logbook can record up to 5 consecutive events, after which these are overwritten, starting from the least recent event.
- > The log file can be visualized using the icon in the standard tool bar.

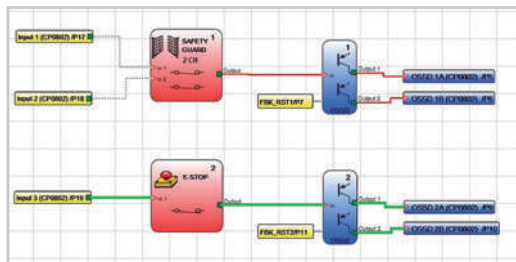

### Main features

#### SoSafe Configurable software main features are:

- > "Drag & Drop" configuration of all safety functions and logic
- > Functional validation of design
- > 2-level password management for the prevention of unauthorised access and therefore of incidental modifications or tampering with system configuration
- > Configuration of parameters of function blocks, for example:
  - single – or double – channel NO or NC inputs
  - test outputs for monitoring of electro-mechanical input devices and photocells and related electrical connections
  - automatic, manual and monitored manual restart
  - synchronisation control of two channels
  - contact anti-rebound filters and timers
  - start-up test.
- > Single or bi-directional 2 or 4 sensor muting function blocks
- > Online monitoring of I/O status
- > Project documentation and schematics

Text visualization

Graphic visualization

The I/O MONITOR allows the real-time monitoring of all the I/O of a Preventa XPSMCM system and the diagnostic information about a working system.

### System requirements

SoSafe Configurable software runs on PC with:

- > RAM: 256 MB
- > Hard disk: free space > 300 MB
- > USB connector: 1.1 or 2.0
- > Microsoft Windows® XP SP3 (service Pack 3) / Vista 32-bit, Microsoft Windows® 7 32 and 64-bit, Microsoft Windows® 8.1 32 and 64-bit
- > Microsoft Framework 3.5 (or higher).

Safety level parameters		
Parameter	Value	Standard
PFH <sub>d</sub>	$\geq 10^{-8}$ PFH <sub>d</sub> < $10^{-7}$	IEC 61508
SIL	3	
SILCL	3	IEC 62061
Type	4	EN 61496-1
PL	e	ISO 13849-1
DC <sub>avg</sub>	High	
MTTF <sub>d</sub> (years)	100 years	
Category	4	
Operation life time	20 years

## Preventa modular safety controller

### type XPSMCM

#### SoSafe Configurable software: operator function blocks

3

### Function blocks

#### Input objects

<b>E-STOP</b>	Verifies an emergency stop device inputs status. If the emergency stop button has been pressed (contacts open) the output is 0. If not the output is 1.
<b>SAFETY GUARD</b>	Verifies a mobile guard or safety gate device input status. If the mobile guard or safety gate is open, the output is 0. Otherwise the output is 1.
<b>ENABLE (enable key)</b>	Verifies a manual key device Input status. If the key is not turned the output is 0. Otherwise the output is 1.
<b>LIGHT CURTAIN (optoelectronic safety light curtain / laser scanner)</b>	Verifies an optoelectronic safety light curtain (or laser scanner) inputs state. If the area protected by the light curtain is occupied, (light curtain outputs 0) the output is 0. Otherwise, with the area clear and outputs to 1 the output of this function block is 1.
<b>FOOTSWITCH (safety pedal)</b>	Verifies the status of the inputs of a safety pedal device. If the pedal is not pressed the output is 0. Otherwise the output is 1.
<b>PHOTOCELL (safety photocell)</b>	Verifies the status of the inputs of an optoelectronic safety photocell. If the beam of the photocell is occupied (photocell output 0) the output is 0. Otherwise with the beam clear and an output of 1 the output is 1.
<b>SELECTOR SWITCH</b>	Verifies the status of the inputs from a mode selector (up to 4 inputs). If only one input is 1 the corresponding output is also 1. In all other cases, and thus when all inputs are 0 or more than one input is 1 all the outputs are 0.
<b>TWO HAND CONTROL</b>	Verifies the status of the inputs of a two hand control switch. If both the buttons are pressed within 500 msec the output is 1. Otherwise the output is 0.
<b>SAFETY MAT (safety mat or safety edge)</b>	Verifies the status of the inputs of a safety mat or safety edge. If a person stands on the mat the output is 0. Otherwise, with the mat clear, the output is 1. Test outputs must be used. Cannot be used with 2-wire mats and termination resistance mats.
<b>ENABLE SWITCH</b>	Verifies the input Inx status of an Enabling Switch. In the event that the switch is not pressed (position 1) or completely pressed (position 3), the OUTPUT will be 0. If it is pressed in the middle (position 2), the output will be 1.
<b>TESTABLE SAFETY DEVICE</b>	The function can be used with every generic input either one or two channels and either NO or NC contacts.
<b>SENSOR</b>	Verifies the status of the input of a sensor (non-safety sensor). If the beam of the sensor is occupied (sensor output 0) the output is 0. Otherwise, with the beam clear and an output of 1 then the output is 1.
<b>LOCK FEEDBACK</b>	Verifies the feedback from the Guardlock solenoid generating a 1 when the guardlock is locked and 0 when open.
<b>SWITCH</b>	Verifies the input status of a pushbutton or switch (non-safety switch). If the pushbutton is pressed the output is 1. Otherwise, the output is 0.
<b>SOLID STATE DEVICE</b>	Verifies INx input status. If the the inputs are High the output is 1 else 0.
<b>FIELDBUS INPUT</b>	Verifies the fieldbus input value signals (up to 8 bits) from the machine control unit via the field-bus module. The signal is connected directly into the configuration.
<b>LL0</b>	0 input value
<b>LL1</b>	1 input value

#### Speed Monitoring

<b>Zero Speed Monitoring</b>	Verifies the speed of a device generating an output 1 when the speed is 0. If the speed is different from 0 generates an output 0 .
<b>Zero and Max Speed Monitoring</b>	Verifies the speed of a device generating an output Zero = 1 when the speed is 0. If the speed is different from 0 generates an output Zero = 0. Moreover, this block verifies the speed of a device generating an output Over = 0 when the speed is over a defined threshold.
<b>Maximum Speed Monitoring</b>	Verifies the speed of a device generating an output 0 when the speed is over a defined threshold.
<b>Speed Range Monitoring</b>	Verifies the speed of a device generating an output 1 when the speed is inside a defined range.

#### Output objects

<b>OSSD (safety outputs)</b>	The OSSD semiconductor PNP safety static output pair. The 2 output cannot operate independently. Each OSSD pair can work in both AUTO/Manual restart mode and can perform the EDM of external relays or contactors using the dedicated RESTART_FBK input.
<b>STATUS (signal output)</b>	The Status outputs are non-safety diagnostic outputs which can be used to provide the status of part of the logic within the configuration.
<b>Relay</b>	The Relay output is used with the XPSMCMRO0004 modules and is configurable to Category 1, 2 and 4.
<b>FIELDBUS PROBE OUTPUT</b>	The fieldbus probe is used to provide the status of part of the logic within the configuration to a PLC or HMI device.

### Function blocks

#### Muting operators

<b>MUTING "L" with 2 Muting sensors, only for one-way openings</b>	Monitors the 2 muting sensors along with the light curtain for L Muting setup.
<b>MUTING "T" with 2 Muting sensors for two-way openings</b>	Monitors the 2 muting sensors along with the light curtain for T Muting setup.
<b>MUTING "Sequential" with 4 Muting sensors for two-way openings</b>	Monitors the 4 muting sensors along with the light curtain for sequential Muting setup.
<b>MUTING "Concurrent" with 4 Muting sensors for two-way openings</b>	Monitors the 4 muting sensors along with the light curtain for concurrent Muting setup.
<b>MUTING OVERRIDE</b>	<p>OVERRIDE command forces the output high allowing to remove the material obstructing the gate.</p> <p>Two different operations are available:</p> <ol style="list-style-type: none"> <li>1 Manual action with hold to run</li> <li>2 Automatic with pulse command</li> </ol>

#### General/Miscellaneous

<b>Serial Output</b>	Transfers the state of up to a maximum of 8 inputs into a serial line data output.
<b>Network</b>	Allows to distribute in a local network Stop and Reset commands between XPSMCMCP0802 controllers.
<b>Interpage IN and Interpage OUT</b>	Memory bit which are reused from inputs to multiple outputs.

#### Memory operators

<b>D FLIP FLOP</b>	Saves the previously set status on output Q on the clock rising edge.
<b>SR FLIP FLOP</b>	Provides an output Q at 1 with Set, 0 with Reset.
<b>USER RESTART MANUAL</b>	Used to create a common reset for multiple input functions on rising edge of the reset input.
<b>USER RESTART MONITORED</b>	Used to create a common reset for multiple input functions on rising edge and falling edge of the reset input.

#### Counter operator

<b>COUNTER</b>	The counter generates a pulse as soon as the set count is reached.
----------------	--

#### Timer operators

<b>PULSE GENERATOR</b>	Generates a clock signal output with the desired period if the input In is 1.
<b>MONOSTABLE</b>	Generates a level 1 output activated by the rising edge of the input and remains in this condition for the set time.
<b>PASSING MAKE CONTACT</b>	The output follows the signal on the input. However, if this is 1 for longer than the set time, the output changes to 0.
<b>DELAY</b>	Applies a delay to a signal by setting the output to 1 after the set time, against a change in the level of the input signal.

#### Logical operators

<b>AND</b>	Returns 1 as output if all the inputs are 1
<b>NAND</b>	Returns 0 as output if all the inputs are 1.
<b>NOT</b>	Inverts the logical status of the input.
<b>OR</b>	Returns 1 as output if at least one of the inputs is 1.
<b>NOR</b>	Returns 0 as output if at least one of the inputs is 1.
<b>XOR</b>	Returns 0 as output if all the inputs are in the same logical status.
<b>XNOR</b>	Returns 1 as output if all the inputs are in the same logical status.
<b>MULTIPLEXER</b>	Forwards the signal of the inputs to the output according to the Sel selection.

# Stop the machine

## Mini-VARIO and VARIO switch disconnectors

**Applications**

Mini-Vario and Vario rotary switch disconnectors from 12 to 175 A are suitable for on-load making and breaking of resistive or mixed resistive and inductive circuits where frequent operation is required. They can also be used for direct switching of motors in utilisation categories AC-3 and DC-3. Vario switch disconnectors are suitable for isolator applications with fully visible breaking (since the handle cannot indicate the "open" position unless all the contacts are actually open and separated by the appropriate isolation distance) and it is possible to padlock the handles in the open position.

## VARIO enclosed switch disconnectors (pre-assembled)

### Enclosed switch disconnectors for high performance applications

- Marking on operator  $\circ \downarrow$ .
- 3-pole rotary switch disconnectors from 10 to 140 A
- Padlockable operating handle (padlock not included).
- IP 65 degree of protection enclosures, sealable and lockable.
- Cover lockable in position "I" (ON) up to 63 A rating.

## Rotating beacons Harmony® type XVR (equipped with Super Bright LED)

XVR13...L

3

### Presentation

The rotating beacons in the Harmony® XVR range are optical signalling units designed for long distance signalling applications. They are used mainly in the iron and steel industry, on industrial handling vehicles or for safety applications.

The range involves complete products offering simplicity of use and speed of installation: they are supplied pre-cabled, and equipped with their light source. The use of "Super-bright" LED's guarantees a good illuminating power and a long service life (reduced time for maintenance) owing to their high resistance to mechanical shock and vibration. These light sources are also energy saving with low power consumption. A reflecting prism can be used for increasing light diffusion.

4 sizes are available:

- Ø 84 mm (XVR08). Colours : red, orange, green and blue,
- Ø 106 mm (XVR10). Colours : red, orange, green and blue,
- Ø 120 mm (XVR12). Colours : red, orange, green and blue,
- Ø 130 mm (XVR13). Colours : red, orange.

For more efficiency, Ø 120 mm rotating beacons may be delivered with a complementary audible unit: a buzzer present at the base of the product, with a continuous or intermittent tone and an adjustable sound level of 50 dB to 90 dB at 1 m.

### Environment

XVR rotating beacons can offer a high degree of protection:

- owing to the adjunction of an accessory : a rubber base guarantees a degree of protection type IP 55 or IP 65 for small models,
- according to the selected model: Ø 130 mm rotating beacons guarantee a degree of protection type IP 66 (resistant to vibration) or IP 67 (see opposite page).

These products meet the requirements of the following standards:

- EN/IEC 61000-6-2 and EN/IEC 61000-6-4 for Ø 84 mm (XVR08), 106 mm (XVR10), 120 mm (XVR12) and 130 mm with direct current (XVR13B●● and XVR13J●●),
- EN/IEC 60947-1 and EN/IEC 60947-5-1 for the other Ø 130 mm rotating beacons (XVR13●●L) with voltage 24V A.C./D.C., 120 V A.C. or 230 V A.C.

These products are CE, UL and CSA certified.

### Connection

The connection is through flying leads, length 400 mm (500 mm for XVR08) and section 0.83 mm<sup>2</sup> (1,25 mm<sup>2</sup> for XVR13).

#### Presentation

The sirens and electronic alarms in the Harmony® XVS range are audible signalling units used for long distance indication of the operating status or sequences of a machine or installation. They are mainly used on conveyor belts, on automated industrial trucks and on the doors of electrical control panels.

The range involves several types of ready to use products:

- sirens with 2 tones, with very compact size, type XVS10,
- multisound sirens (43 tones), pre-cabled, 8 channels, type XVS14.

The sound, with continuous or intermittent tone:

- guarantees a sound level of 106 dB at 1 m for XVS10,
- can be adjusted from 0 to 105 dB at 1 m for XVS14.

#### Environment

The XVS sirens and electronic alarms offer the following degree of protection: IP 53 for sirens type XVS10 and XVS14.

These products meet the requirements of the following standards:

- EN/IEC 61000-6-2 and EN/IEC 61000-6-3 for voltages 120 V and 230 V A.C. (XVS14BMW),
- EN/IEC 60947-1 and EN/IEC 60947-5-1 for voltages 12 V and 24 V A.C. (XVS10, XVS14GMW and MMW).

They are CE, UL and CSA certified.

#### Connection

Products are to be connected:

- through cable-glands for using 6.5 mm to 8.5 mm cables (XVS10)
- through power wire c.s.a.: 0.52 mm<sup>2</sup> and signal wire c.s.a.: 0.33 mm<sup>2</sup>, with flying leads, length 500 mm (XVS14),
